

CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD
CENTRAL VALLEY REGION

ORDER R5-2015-0133

WASTE DISCHARGE REQUIREMENTS
FOR
SACRAMENTO REGIONAL COUNTY SANITATION DISTRICT
SACRAMENTO REGIONAL WASTEWATER TREATMENT PLANT
BIOSOLIDS AND SOLIDS STORAGE AND DISPOSAL FACILITIES
CLASS II LAND TREATMENT UNITS
UNCLASSIFIED SOLIDS STORAGE BASINS
CLASS III LANDFILL
CONSTRUCTION, CLOSURE, POST-CLOSURE MAINTENANCE
AND CORRECTIVE ACTION
SACRAMENTO COUNTY

The California Regional Water Quality Control Board, Central Valley Region, (hereafter Central Valley Water Board) finds that:

1. The Sacramento Regional County Sanitation District (hereinafter Discharger) owns and operates treatment, storage and disposal facilities for digested sludge (or 'biosolids') and solids generated from the Sacramento Regional Wastewater Treatment Plant (facility) about eight miles south of Sacramento and one mile east of the town of Freeport, as shown in Attachment A. The facility is located in the Southwest Quarter of Section 17, South Half of Section 18, Section 19, Section 20, Northwest Quarter of Section 29, North Half of Section 30, Township 7 North, Range 5 East, Mount Diablo Baseline Meridian; and the South Half of Section 13, East Half of Section 24, East Half of Section 25, Township 7 North, Range 4 East, Mount Diablo Baseline Meridian. The facility was previously regulated by Waste Discharge Requirements (WDRs) Orders 98-087, 5-01-263, and R5-2003-0076 in conformance with Title 27, California Code of Regulations (27 CCR), Division 2, Subdivision 1 (hereafter Title 27).
2. The following documents are attached to this Order and hereby incorporated into and made a part of this Order by reference:
 - a. Attachment A – Site Location Map
 - b. Attachment B – Site Plan
 - c. Attachment C – Existing Groundwater Wells Plan
 - d. Attachment D – Lined Dedicated Land Disposal Areas Monitoring Locations
 - e. Attachment E – Closed Class III Landfill Gas Monitoring Locations
 - f. Information Sheet
 - g. November 2013 Standard Provisions And Reporting Requirements
3. The wastewater treatment plant process area and waste management facilities occupy about 900 acres of the 3,550 acre site. The facilities regulated by these WDRs include

twenty unclassified Solids Storage Basins (SSBs), five Class II land treatment units (LTUs) referred to as Dedicated Land Disposal Units (DLDs) [three active, lined DLDs (L-DLDs) and two closed, unlined (C-DLDs)], and a closed Class III grit and screenings landfill (closed landfill). A site plan of the facility is shown on Attachment B.

4. The SSBs function as sewage sludge treatment and storage units and meet the requirements for exemption from Title 27 provisions, pursuant to Title 27 §20090 (a):
(a) Sewage—Discharges of domestic sewage or treated effluent which are regulated by WDRs issued pursuant to Chapter 9, Division 3, Title 23 of this code, or for which WDRs have been waived, and which are consistent with applicable water quality objectives, and treatment or storage facilities associated with municipal wastewater treatment plants, provided that residual sludges or solid waste from wastewater treatment facilities shall be discharged only in accordance with the applicable SWRCB-promulgated provisions of this division.
5. The SSBs are exempt from Title 27; however, the SSBs are subject to the State Water Resources Control Board Resolution 68-16 (“Policy with Respect to Maintaining High Quality Waters of the State”) (hereafter Resolution 68-16) which prohibits degradation of high quality groundwater unless it has been shown that:
 - a. The degradation is consistent with the maximum benefit to the people of the state;
 - b. The degradation will not unreasonably affect present and anticipated future beneficial uses;
 - c. The degradation does not result in water quality less than that prescribed in state and regional policies, including violation of one or more water quality objectives; and
 - d. The discharger employs best practicable treatment or control (BPTC) to minimize degradation.
6. Surface water discharges are regulated by WDR Order R5-2010-0114-003 (National Pollutant Discharge Elimination System Permit CA0077682), which is not subject to the terms of this Order.
7. On 29 May 2015, the Discharger submitted an amended Report of Waste Discharge (ROWD). The information in the ROWD has been used in revising these WDRs. The ROWD contains the applicable information required in Title 27. The ROWD and supporting documents contain information related to this revision/update of the WDRs including:
 - a. Evaluating potential groundwater impacts from the SSBs
 - b. Utilizing C-DLD 1 for soil stockpiles and haul roads during plant construction work beginning in 2015

- c. Converting previously closed C-DLDs 1 and 5 to L-DLDs
- d. Clean-closing the closed landfill
- e. Redirecting return flow from the Biosolids Recycling Facility (BRF) to the SSBs

8. The existing and future waste management units authorized by this Order are described as follows:

<u>Unit</u>	<u>Area</u>	<u>Liner/LCRS¹ Components²</u>	<u>Unit Classification & Status</u>
C-DLD 1 and C-DLD 5 ³	82 acres	Unlined. Cover system - evapotranspirative cover.	Class II, Closed in 2004.
L-DLD 2 to L-DLD 4 ³	123 acres	Single Composite Liner – one foot compacted clay subgrade, 60-mil HDPE, 12-inch blanket LCRS.	Class II, Active.
SSBs (20 ponds)	125 acres	Unlined surface impoundment.	Unclassified, Active.
Grit and Screenings Landfill ⁴	23 acres	Ten unlined disposal trenches. Cover system - two feet foundation soils, one foot low permeability soil with 1×10^{-6} cm/sec hydraulic conductivity, one foot vegetative cover soil.	Class III, Closed in 1994.

¹ LCRS – Leachate collection and removal system

² All liner systems are composite liner systems unless otherwise noted

³ Each C-DLD and L-DLD is comprised of a 37 acre biosolids injection area and a 4 acre lined storm water runoff area.

⁴ Waste disposed of in approximately 8 acres of the 23 permitted acres.

9. On 25 April 2003, the Central Valley Water Board issued WDR Order R5-2003-0076 in which the DLDs at the facility were classified as a Class II land treatment units for the discharge of designated waste, the SSBs at the facility were unclassified and exempt from Title 27, and the grit and screenings landfill was classified as closed Class III landfill. This Order continues to classify DLDs as Class II land treatment units and the grit and screenings landfill as a closed Class III landfill in accordance with Title 27. Additionally, this Order continues to classify the SSBs as unclassified and exempt from Title 27.
10. Since the adoption of the 2003 WDRs, the facility improvements include: installation of a liner system on DLD 3 in 2003, closure of DLDs 1 and 5 in 2004, installation of

groundwater monitoring wells in the vicinity of the SSBs, and construction and operation of a BRF.

11. The Discharger began construction of the EchoWater Project in 2015 to update various wastewater treatment process areas, which are not subject to the terms of this Order. In support of the EchoWater Project, the Regional Board approved temporary construction activities on top of C-DLD 1 including stockpiling soil and constructing a haul road for construction equipment. Additionally, the Discharger may clean-close all or a portion of the closed landfill following written approval by the Executive Officer to utilize this area for additional treatment process facilities to be constructed as part of the EchoWater Project.
12. This Order implements the applicable regulations for discharges of solid waste to land through Prohibitions, Specifications, Provisions, and monitoring and reporting requirements. Prohibitions, Specifications, and Provisions are listed in Sections A through H of these WDRs below, and in the Standard Provisions and Reporting Requirements, dated November 2013 (SPRRs) which are attached hereto and made part of this Order. Monitoring and reporting requirements are included in the Monitoring and Reporting Program (MRP) R5-2015-0133 and in the SPRRs. In general, requirements that are either in regulation or otherwise apply to all facilities regulated under Title 27 are considered to be "standard" and are therefore in the SPRRs. Any site-specific changes to a requirement in the SPRRs are included in the applicable section (A through H) of these WDRs, and the requirement in the WDRs supersedes the requirement in the SPRRs.

WASTE CLASSIFICATION AND UNIT CLASSIFICATION

13. The Discharger proposes to continue to discharge anaerobically digested sludge to the SSBs. The digested sludge has about 0.4% to 3% solids. The solids are composed of about 50% to 80% volatile solids. Digested sludge may also contain variable concentrations of contaminants, such as heavy metals, chlorinated hydrocarbons and pathogens. When the digested sludge is placed in the SSBs, it undergoes further stabilization (i.e., reduction of volatile solids and pathogens). The reduction of volatile solids tends to concentrate constituents such as heavy metals, inorganic chemicals, and stable chlorinated hydrocarbons (i.e., Aroclor (PCBs) compounds).
14. The Discharger also proposes to redirect return flow from the BRF to the SSBs. Currently, approximately 35% of the digested sludge is routed to the BRF for processing to produce a pelletized fertilizer and the rest is discharged to the SSBs. The BRF uses polymer to dewater then thermally dries the digested sludge to EPA 503b Class A quality. Secondary effluent from the wastewater treatment plant is also used in the dryer exhaust for cooling and particulate removal. The BRF then returns the centrate as BRF return flow to the waste water treatment via a sanitary drain. This BRF return flow may contain trace amounts of polymer from dewatering. The BRF return flow contains significantly less solids and reduced ammonia concentration than digested sludge. When

the BRF is not operating, digested sludge flow normally going to the BRF is sent to the SSBs.

15. The stabilized sludge (or biosolids) is in an anaerobic and chemically reduced state when it is harvested from the SSBs and discharged to the L-DLDs. When it is exposed to an aerobic environment it becomes oxidized and, due to microbial action, gains an acid generating potential, which could increase the solubility of several heavy metals. The Discharger conditions the L-DLD soils by adding lime to prevent heavy metals from solubilizing.
16. The stabilized sludge is essentially a liquid waste containing constituents at concentrations that if released under ambient conditions at the facility have the potential to degrade waters of the state. The stabilized sludge is classified as a 'designated waste' pursuant to the criteria set forth in §20210 of Title 27.
17. Water Code section 13173 defines "Designated Waste" as either of the following:
 - a. Hazardous waste that has been granted a variance from hazardous waste management requirements pursuant to Health and Safety Code section 25143.
 - b. Nonhazardous waste that consists of, or contains, pollutants that, under ambient environmental conditions at a waste management unit, could be released in concentrations exceeding applicable water quality objectives or that could reasonably be expected to affect beneficial uses of the waters of the state as contained in the appropriate state water quality control plan.

Designated waste can be discharged only at Class I waste management units, or at Class II waste management units which comply with Title 27 and have been approved by the regional board for containment of the particular kind of waste to be discharged.

18. The Discharger provided 2014 monitoring data in the 2014 Annual Monitoring Report for SSBs waste constituents including SSB liquid supernate and digested sludge discharged to the SSBs, as shown on Tables 1 and 2. The liquid supernate concentrations are compared to California primary maximum contaminant levels (primary MCLs), the lowest applicable water quality objective (WQO) for groundwater for protection of drinking water beneficial use for domestic and municipal supply wells, and the background groundwater quality at the site.
19. Solids discharged into the SSBs contain high concentrations of ammonia, total nitrogen, chloride, sulfate, and total phosphorus (Table 1). Additionally, SSB supernate concentrations of total dissolved solids (TDS) and specific conductivity remain above the associated secondary MCLs by more than double (Table 2). SSB supernate is aerated and diluted with storm water lowering concentrations of potential constituents of concern; however, the dilution is not enough to reduce TDS and specific conductivity below the MCLs.

**Table 1 – SSB Waste Discharge
Digested Sludge 2014 Average Concentrations**

Constituent	Units¹	Average Concentration
Ammonia	mg/kg	63,000
Nitrate	mg/kg	5
Nitrite	mg/kg	3
Chloride	mg/kg	7,000
Soluble Sulfate	mg/kg	1,300
Arsenic	mg/kg	5.4
Total Nitrogen	mg/kg	125,000
Total Phosphorus	mg/kg	28,000

1. Sample was reported on a dry weight basis

Table 2 – SSB Supernate 2014 Average Concentrations

Constituent	Units	SSB Average	Water Quality Criteria (WQC)/Water Quality Objective (WQO)	
			WQC/ WQO	Reference^{1, 2, 3, 4}
Total Dissolved Solids (TDS)	mg/L	1,100	500	CDPH Secondary MCL
Specific Conductivity	µmhos/cm	3,900	900	CDPH Secondary MCL
Ammonia Nitrogen	mg/L	430	30	USEPA Health Advisory
Nitrate	mg/L	0.1	10	USEPA Primary MCL
Nitrite	mg/L	1.0	1.0	USEPA Primary MCL
Chloride	mg/L	140	250	CDPH Secondary MCL
Sulfate	mg/L	200	250	CDPH Secondary MCL

1. CDHS = California Department of Public Health
2. USEPA = United States Environmental Protection Agency
3. IRIS RfD = Integrated Risk Information System, Reference Dose
4. MCL = Maximum Contaminant Level

20. The Discharger provided 2014 monitoring data in the 2014 Annual Monitoring Report for biosolids harvested from the SSBs discharged to the L-DLDs and L-DLD leachate, as shown in Tables 3 and 4. The liquid leachate concentrations are compared to California primary maximum contaminant levels (primary MCLs), the lowest applicable water quality objective (WQO) for groundwater for protection of drinking water beneficial use for domestic and municipal supply wells, and the background groundwater quality at the site.
21. Biosolids harvested from the SSBs continue to have high concentrations of ammonia, total nitrogen, chloride, sulfate, and total phosphorus (Table 3) similar to the digested

sludge. The biosolids concentrations are lower than the digested sludge. Additionally, average concentrations of leachate from the L-DLDs show levels of TDS, specific conductivity, nitrate, nitrite, chloride, and sulfate above primary and secondary MCLs (Table 4).

**Table 3 – L-DLD Waste Discharge
SSB Harvested Biosolids 2014 Average Concentrations**

Constituent	Units ¹	Average Concentration
Ammonia	mg/kg	13,500
Nitrate	mg/kg	1.1
Nitrite	mg/kg	0.9
Chloride	mg/kg	2,300
Soluble Sulfate	mg/kg	800
Arsenic	mg/kg	9.0
Total Nitrogen	mg/kg	51,000
Total Phosphorus	mg/kg	34,000

1. Sample was reported on a dry weight basis

Table 4 – L-DLD Leachate 2014 Average Concentrations

Constituent	Units	LDLDs Average	Water Quality Criteria (WQC)/Water Quality Objective (WQO)	
			WQC/WQO	Reference ^{1, 2, 3, 4}
Total Dissolved Solids (TDS)	mg/L	4,600	500	CDPH Secondary MCL
Specific Conductivity	µmhos/cm	10,400	900	CDPH Secondary MCL
Ammonia	mg/L	0.1	30	USEPA Health Advisory
Nitrate	mg/L as N	1,100	10	USEPA Primary MCL
Nitrite	mg/L	60	1.0	CDPH Primary MCL
Chloride	mg/L	100	250	CDPH Secondary MCL
Sulfate	mg/L	1,200	250	CDPH Secondary MCL
Arsenic	µg/L	11	10	CDPH Primary MCL
Phosphorus	mg/L	2.3	0.00014	U.S. EPA IRIS RfD

1. CDHS = California Department of Public Health
2. USEPA = United States Environmental Protection Agency
3. IRIS RfD = Integrated Risk Information System, Reference Dose
4. MCL = Maximum Contaminant Level

22. The data indicates that the discharge to the SSBs and L-DLDs consists of or contains pollutants that, under ambient environmental conditions at a waste management unit, could be released in concentrations exceeding applicable water quality objectives or that could reasonably be expected to affect beneficial uses of the waters of the state.

Therefore, the discharge is a 'designated waste'. Discharge to the SSBs is exempt from Title 27. However, discharge of the biosolids harvested from the SSBs must be discharged to a Class II waste management unit as required by Title 27.

23. Leachate collected from the L-DLDs and excess SSB supernate is returned to the headworks of the wastewater treatment plant for treatment.

SITE DESCRIPTION

24. Existing on-site land use consists of the wastewater treatment plant processing areas and a significant acreage for buffer isolation for the treatment processes (Bufferlands). The approximately 2,650 acre Bufferlands provides open space minimizing the potential for odor and other nuisances that could impact the surrounding neighborhoods. Additionally, the Bufferlands provides hundreds of acres for wildlife habitat and farmland.
25. The Bufferlands surround the facility by a minimum of 1,000 feet on all sides of the facility to over a mile to the east. Additional land uses within one mile of the facility include water treatment facilities, residential, agriculture, and commercial to the north; industrial, commercial, residential, institutional, public open space/recreation, public parks and public schools to the south; industrial to the east; and agricultural, natural preserve, and public open space to the west.
26. There are no known municipal, domestic, or industrial supply wells within one mile of the facility. Five groundwater supply wells are located on the facility property for use as irrigation and process wells. Locations of these wells are shown on Attachment C.
27. The site geology primarily consists of Riverbank Formation made up of interbedded layers of sand, silt, clay, and gravel. In general, a claypan/hardpan is observed in the upper 15 to 20 feet below ground surface (bgs) overlying a interbedded layer of fine sands and silts to approximately 30 to 35 feet bgs. At approximately 30 to 35 feet bgs, a 15 to 20-foot thick layer of un-cemented to very weakly cemented silts and clays overlays a gravel and cobble layer that may extend to a depth of 140 feet bgs.
28. The measured hydraulic conductivity of the native soils underlying the waste management units ranges between 10^{-4} and 10^{-8} centimeters per second (cm/s).
29. Based on a site-specific seismic analysis, the controlling maximum credible earthquake (MCE) for the site is a combination of events occurring along the Great Valley fault Segment 6 located approximately 35 kilometers from the site and the San Andreas fault located approximately 121 kilometers from the site. The Great Valley fault Segment 6 controls the short periods of shaking at the site (up to 1.2 seconds), while the San Andreas fault controls longer period motions at the site (1.2 seconds and greater). The near-field MCE for the site is a 6.8 Mw located 35 kilometers from the site on the Great Valley fault Segment 6 producing a peak ground acceleration in rock of 0.128 g. The far-

field MCE is an 8.0 Mw located 121 kilometers from the site on the San Andreas fault producing a peak ground acceleration in rock of 0.071 g.

30. The average annual precipitation at the facility is 18.3 inches based on the Sacramento Executive Airport Station (approximately 5 miles north of the project site). About 86 percent of the precipitation occurs between October and March. The mean evapotranspiration is 50.48 inches per year as measured at the Fair Oaks, California Irrigation Management Information System Station.
31. The 100-year, 24-hour precipitation event for the facility is estimated to be 5.52 inches based on National Oceanic and Atmospheric Administration precipitation frequency estimates for the Sacramento Executive Airport dated August 27, 2014. The 100-year wet year was calculated to be 32.1 inches, based on data from the Department of Water Resources for the Sacramento Executive Airport Station.
32. The 1,000-year, 24-hour precipitation event for the facility is estimated to be 7.44 inches, based on National Oceanic and Atmospheric Administration precipitation frequency estimates for the Sacramento Executive Airport dated August 27, 2014.
33. The waste management facility is within a 100-year flood plain based on the Federal Emergency Management Agency's (FEMA) Flood Insurance Rate Map #06067C0305H and #06067C0315H. The site is protected from flooding by a levee system that has crest elevations ranging from a minimum of 20.7-feet above mean sea level (msl) at the southwest corner of the treatment facilities to 22.0-feet above msl at the northeast corner of the treatment facilities. The perimeter levee system provides the entire treatment plant process area with protection from a 400-year flood event.

SURFACE WATER AND GROUNDWATER CONDITIONS

34. The *Water Quality Control Plan for Sacramento and San Joaquin River Basins, Fourth Edition* (hereafter Basin Plan), designates beneficial uses, establishes water quality objectives, and contains implementation plans and policies for all waters of the Basin.
35. The site is on a low-lying alluvial basin at the confluence of Morrison, Beacon and Laguna Creeks. Currently, Morrison, Beacon, and Laguna Creeks converge on the north side of the property and drain westerly into the Beach-Stone Lakes Basin. The Beach-Stone Lakes Basin lies within the Morrison Creek, Cosumnes River and Mokelumne River watersheds as well as the Sacramento-San Joaquin Delta.
36. The designated beneficial uses of Sacramento River, as specified in the Basin Plan, are municipal and domestic supply; agricultural supply, including stock watering; industrial process supply; industrial service supply; water contact recreation; non-contact water recreation; warm freshwater aquatic habitat; cold freshwater aquatic habitat; warm migration, cold migration of aquatic organisms; warm spawning, reproduction, and/or early development; wildlife habitat; and navigation.

37. Two water-bearing zones have been identified beneath the site. The upper zone is referred to as the shallow saturated zone and is encountered between approximately 30 and 50 feet bgs. The second zone is referred to as the first aquifer and is encountered between approximately 60 and 75 feet bgs.
38. Based on the September 2013 measurements of groundwater elevation, the shallow aquifer has a potentiometric surface between approximately 87.5 and 102.5 feet above msl, and the first aquifer has a water table elevation between approximately 66.0 and 96.0 feet above msl using the site datum of 100 feet above msl.
39. Groundwater flow in the shallow aquifer is generally toward the east-southeast with a flow gradient of about 0.003 foot per foot based on the September 2013 groundwater contours prepared by the Discharger.
40. Groundwater flow is more complicated within the first aquifer because of the groundwater extraction pumping that occurs along the eastern margins of the DLDs. However, in general, groundwater in the first aquifer flows from the west to east under the DLDs to the extraction wells. East of the treatment plant, outside of the influence of the extraction wells, the first aquifer flows in an easterly direction.
41. Monitoring data from the 2014 Annual Report indicates background groundwater quality for each groundwater zone consists of TDS and EC ranges shown in Table 5 below.

Table 5 – Background 2014 EC and TDS Concentrations

Groundwater Zone	EC (micromhos/cm)	TDS (mg/L)
North Shallow	400 to 780	210 to 460
South Shallow	3,500 to 3,800	2,200 to 2,900
North First Aquifer	360 to 660	230 to 440
South First Aquifer	1,900 to 2,000	1,000 to 1,500

42. The designated beneficial uses of the groundwater, as specified in the Basin Plan, are domestic and municipal water supply, agricultural supply, industrial service supply, and industrial process supply.

GROUNDWATER, UNSATURATED ZONE, AND SURFACE WATER MONITORING

43. The existing groundwater monitoring network for the SSBs, DLDs, and closed landfill consists of the background monitoring wells, extraction wells, and detection monitoring wells listed in Table 6 below and, as shown on Attachment C.

Table 6 – Existing Groundwater Well Network

Well	Status	Zone	Well Screen (feet bgs)	Area Being Monitored

* Extraction wells are part of the corrective action program and considered corrective action wells for monitoring requirements as specified in MRP R5-2015-0133.

44. At the time this Order was adopted, the Discharger's detection monitoring program for groundwater at the facility satisfied the requirements contained in Title 27.
45. Each L-DLD contains two LCRS sumps that gravity drain via underground pipes to one pump-station. The L-DLD pump-station locations are shown on Attachment D. The unsaturated zone monitoring system for the L-DLDs consists of a pan lysimeter located at the lowest areas of the L-DLD for a total of two pan lysimeters in each L-DLD as shown in Attachment D. The Discharger's detection monitoring program for the unsaturated zone for the L-DLD units meets the requirements contained in Title 27.
46. C-DLDs 1 and 5, SSBs, and the closed landfill do not have unsaturated zone monitoring devices.

47. No surface water monitoring is required because storm water runoff from both the DLDs and the closed landfill is collected in storm water basins and routed to the headworks of the wastewater plant for treatment. Storm water that flows into the SSBs either remains in the SSBs or gets routed to the headworks of the wastewater treatment plant for treatment.
48. The Discharger has not submitted a Sampling Collection and Analysis Plan (SAP) Report for this site, which includes sampling and analysis quality assurance/quality control standards. These WDRs require that the Discharger develop a SAP detailing the sampling collection and analysis procedures including quality assurance/quality control standards, as detailed in Provision H.
49. The Discharger submitted a Water Quality Protection Standard (WQPS) report proposing statistical data analysis methods to calculate concentration limits for groundwater in October 1992. The WQPS report proposed to use Interwell data analysis to calculate prediction limits for the monitored constituents. The WQPS does not include concentration limits for vadose zone monitoring and has not been updated to include additional monitoring data since 1992. These WDRs require that the Discharger develop a complete list of concentration limits for each unit and submit a WQPS Report describing the WQPS for each unit consistent with the requirements of this Order, as detailed Provision H.

GROUNDWATER CORRECTIVE ACTION

50. The Discharger has identified an increase in the concentration of inorganic constituents (salts) in samples from groundwater monitoring wells downgradient from the waste management units when compared to samples from upgradient groundwater monitoring wells. Soil pore-water monitoring also detected elevated inorganic constituents in the unsaturated zone beneath the DLDs. The increased inorganic concentrations consisted primarily of nitrate, chloride, and total dissolved solids.
51. During December 1995, the Discharger implemented a corrective action program to remediate groundwater impacts that consists of groundwater extraction from ten extraction wells at the downgradient edge of the DLDs. The intent of the program is to capture and remove nitrate and salt impacted groundwater. The extracted groundwater is discharged to the wastewater treatment plant secondary effluent or to the constructed wetlands under a NPDES permit R5-2010-0114-04. The Discharger expanded the corrective action program in 2000 with the addition of seven groundwater extraction wells. The new wells were expected to increase the overall groundwater pumping rate from 0.25 million gallons per day to approximately 1.0 million gallons per day. The flow rates were not as great as expected and some of the extraction wells did not have enough water for pumping. Subsequently, by 2008 all four of the shallow extraction wells (MW-235, MW-233, MW-236, and MW-228R) were shut down. Currently, the thirteen first aquifer extraction wells have an average pumping rate of approximately 0.4 million gallons per day. The Discharger evaluated processes for pollutant source control from the existing DLDs prior to closure. These processes include: (1) injecting

biosolids closer to the surface of the DLDs, (2) discing sooner to promote evaporation, and (3) regrading/rolling the DLDs prior to the winter to promote storm water runoff.

52. The Discharger lined or closed the DLDs to remediate the groundwater impacts from the DLDs. Liner installation for DLDs 2 and 4 was completed during 2002 and for DLD 3 in 2003. DLDs 1 and 5 were closed during 2004 with an ET cover and are not lined.
53. The R5-2003-0076 WDRs required a groundwater monitoring program to determine if leakage from the SSBs is occurring and impacting groundwater quality. The Discharger installed 6 monitoring wells in 2009 in the vicinity of the SSBs to collect the required data to assess the potential impacts of the SSBs on groundwater quality. The wells were sampled semi-annually beginning in August 2010 for the same constituents as the other on-site groundwater monitoring wells as specified in MRP R5-2003-0076.
54. Some of the recently installed groundwater wells downgradient of the SSBs have concentrations of TDS, nitrates and salts above background indicating that the SSBs may be impacting the groundwater. These WDRs require that the Discharger submit an antidegradation analysis to determine if groundwater degradation is being caused by the SSBs as detailed in Provision H.

DESIGN OF WASTE MANAGEMENT UNIT(S)

55. Water Code section 13360(a)(1) allows the Central Valley Water Board to specify the design, type of construction, and/or particular manner in which compliance must be met in waste discharge requirements or orders for the discharge of waste at solid waste disposal facilities.

Closed Class III Landfill

56. Approximately 8 acres of the 23-acre landfill received grit, screenings, ash, and inert construction wastes. The landfill, closed in 1994, had a capacity of about 1.16 million cubic yards and it was estimated that approximately 36,000 cubic yards of waste was placed within the 8 acres that was used. The landfill is covered by a 1-foot vegetative layer, a 1-foot thick low permeability layer, and a foundation layer with a minimum thickness of two feet.
57. The Discharger conducts landfill gas monitoring as required by CalRecycle and the Local Enforcement Agency (LEA). In February 2012, The LEA approved reducing the monitoring to three landfill gas wells to maintain 1,000 foot well spacing. Attachment E shows the locations of the current landfill gas monitoring wells GW-6, GW-9, and GW-10. The Discharger shall include copies of the CalRecycle landfill gas monitoring reports with the annual monitoring reports as specified in MRP R5-2015-0133.

Unclassified Solids Storage Basins

58. The eight Battery I SSBs were constructed in the mid 1970's underlain by silty clayey materials with permeabilities ranging from 10^{-4} to 10^{-7} cm/sec. The Battery I SSBs are each approximately 275 to 400 feet in width, 600 to 700 feet in length, and 12 feet deep.
59. The eight Battery II and four Battery III SSBs were constructed in the early 1980's underlain by silty clayey materials with permeabilities ranging from 10^{-6} to 10^{-8} cm/sec. The Battery II and III SSBs are each approximately 450 feet in width, 725 feet in length, and 15 feet deep.
60. Twenty SSBs receive about 6,000 tons of digested sludge (wet weight) per day for storage and stabilization. The sludge typically remains in the SSBs for three to five years. The SSBs are designed as facultative lagoons to control odors and to enhance sludge stabilization. Stored sludge is removed seasonally using a floating hydraulic dredge, which pumps the stabilized sludge to the DLDs.
61. In general, the SSBs receive inflows of digested sludge while supernatant and sludge are discharged and harvested from the SSBs. Digested sludge is discharged into the SSBs via one of two digested sludge pipes located at the bottom of each pond. Each SSB receives digested sludge based on a computerized control strategy that incorporates operator inputs to regulate the total volume into each SSB in sequential order. The operating levels in each SSB pond are maintained at 14.0 feet above msl with approximately 3.5 feet of freeboard at the level of the supernate outflow pipe. The Battery II and III SSBs are also equipped with overflow pipes (at 15.0 feet above msl) which provide approximately 2.5 feet of freeboard that discharge liquid to a metering structure and back to the wastewater treatment plant headworks as additional protection.
62. A typical water balance model has not been prepared because the Discharger's operational procedures provide protection against overfilling of the SSBs. Specifically, the Discharger controls maximum inflows of digested sludge to each SSB to prevent exceeding capacity. Additionally, the SSBs are hydraulically controlled with supernate discharge pipes that lead back to the wastewater treatment plant headworks. Finally, the Battery II and III overflow system provide additional emergency protection against overfilling while maintaining approximately 2.5 feet of freeboard. Based on the operational procedures and historical data, the Discharger reports that the SSBs have sufficient capacity to maintain two feet of freeboard.
63. This Order requires the SSBs to have capacity for wastewater flows to the SSBs, precipitation, and precipitation runoff from a 100-year wet year of 32.1 inches distributed at least monthly, and shall maintain at least two (2.0) feet of freeboard at all times, except during harvesting operations when the freeboard shall be maintained at a minimum of 1.5 feet, as detailed in Specification C and Provision H.

Class II Dedicated Land Disposal Units

64. There are five 40-acre DLDs that have received stabilized sludge (biosolids) from the SSBs. Discharge of biosolids will continue at L-DLDs. This Order allows C-DLDs to be converted to L-DLDs if the waste is removed and they receive liners as detailed in Specification D. Biosolids are applied to the L-DLDs as a semi-liquid (about 7% solids) by subsurface injection to the upper 6 to 8 inches. The biosolids are applied to the L-DLDs during the dry season (typically from May through October). The Discharger applies lime as needed to maintain the proper soil pH and prevent leaching of heavy metals. The L-DLDs are graded to prevent ponding.
65. Construction of L-DLDs will proceed only after all applicable design plans, specifications, and construction quality assurance plans have been approved by Executive Officer.
66. Title 27 §20250 states that the maximum depth of a Class II LTU treatment zone shall not exceed 5 feet from the initial soil surface. The site specific soil conditions and waste characteristics indicate that the upper five feet would not achieve the performance goals of §20250 for the degradation, immobilization and transformation of nutrients and salts. However, it was initially thought that the deeper soils, in the deep percolation zone, would meet the performance goals of §20250 and would protect against water quality impairment. Pursuant to §20080 of Title 27, the DLDs were considered engineered alternative LTUs for the five-foot treatment zone prescriptive standards under Regional Board Order 90-151. Subsequent monitoring demonstrated that the nutrients and salts are readily transported through the unsaturated zone to groundwater. To remediate the impacts to groundwater, WDR R5-2003-0076 required the DLDs to be closed or lined.

DLD Liner Systems

67. Pursuant to §20435(r)(2) of Title 27, the Discharger lined DLDs 2, 3 and 4 due to groundwater impacts. Prior to lining a DLD, the Discharger excavated existing biosolids waste and native soil to a depth of about five-feet. The liner was then constructed, and the soil and biosolids placed on the liner system. The DLD liner system, from top to bottom, is as follows:
 - a. an LCRS consisting of 12-inches of 3/8-inch pea gravel, filter fabric and drainage piping;
 - b. a 60-mil HDPE geomembrane;
 - c. native clayey soils that have been moisture conditioned and compacted;
 - d. two LCRS sumps connected via underground pipes to one pump-station per each L-DLD; and

- e. two pan lysimeters underlying pipe penetrations of the liner which are the lowest points in the LCRS.
68. Title 27 section 20370(a) requires Class II units to be designed to withstand the maximum credible earthquake (MCE) without damage to foundation or containment structures. The Discharger did not submit a stability analysis for the L-DLDs. As an alternative, a 1995 stability analysis for a nearby biosolids recycling facility was submitted as the stability analysis. The Discharger determined that for the L-DLDs no additional stability analyses were required as detailed in the 2002 ROWD.
69. The Discharger submitted a Construction Quality Assurance program for lining DLDs 2 through 4 requiring the native soils to be fine-grained soils with significant clay content that are SC, CL or CH per the Unified Soil Classification System and that visual classification would be conducted on a 100-foot horizontal grid. Any area of soil that was not classified as SC, CL or CH was excavated to a depth of one-foot and replaced by fine-grained clayey soils. Laboratory testing for particle size distribution, Atterberg Limits and moisture-density were also conducted. Liner system installation was completed for DLDs 2 and 4 during 2002, and in 2003 for DLD 3.
70. The Discharger also lined the DLD storm water runoff areas (runoff zones) that are adjacent to each of the DLDs. A low area of about 5-acres exists adjacent to each of the approximately 40-acre DLDs where storm water is collected and gravity drained to a sanitary sewer and routed back to the treatment plant headworks. The Discharger lined each of the runoff zones adjacent to the DLDs using a 45-mil polypropylene geomembrane. The lined runoff zone areas can contain storm water runoff from a 1,000-year, 24-hour storm event as reported in the 2002 ROWD.
71. The runoff zones are equipped with pipes that that can discharge runoff from a 10-year, 24-hour storm event. During an extreme event in 1995, the Discharger reported that runoff backed up into the runoff zone areas to a depth of 2 to 3 feet for a period of about 24-hours. The Discharger reported that gates controlling the runoff zone outlets are not closed as an operational practice, even during large storm events. The Order allows these gates to be closed to minimize flows to the treatment plant headworks under an emergency situation when operations staff may deem it necessary for the protection of public safety or property, or preservation of the facility equipment. These emergency situations would be when upstream overflows or public damage is likely, or if simultaneous failures of treatment plant influent pumps and/or process units occur that require immediate cutback in plant flow. The 45-mil polypropylene liner will significantly reduce any percolation of DLD storm water runoff in the runoff zones during times when storm water backs up into them. The runoff zones for DLDs 2 and 4 were lined during 2002, and DLD 3 was lined in 2003.
72. Each L-DLD has an unsaturated zone monitoring system consisting of a pan lysimeter located at the lowest areas of the L-DLD for a total of two lysimeters per L-DLD. In 2004 and 2006, leaks were discovered in L-DLD 3SW, L-DLD 3SE, and L-DLD 4NW. The

Discharger investigated these leaks and concluded that the LCRS pipe boot was leaking into the lysimeter at L-DLD 3SW and L-DLD 3SE. Additionally, a portion of the primary and lysimeter liner systems were not welded together at L-DLD 4NW. The Discharger repaired the leak at L-DLD 4NW, but not at L-DLD 3SW and L-DLD 3SE because it could potentially cause more damage to excavate the pipe boot for repairs causing the repairs to not be successful. The Discharger monitors the water levels in the lysimeters, periodically removes the water, and reports the quantities of liquids removed in the semi-annual monitoring reports.

73. The WDRs Order 98-087 required the Discharger to maintain DLD soil pH above 6.5 in order to prevent heavy metals from solubilizing from the DLD soils. The Discharger proposed a reduction in the required pH limit to 5.0, with a target operating range of 5.2 to 5.5. The Discharger has reported that research on biosolids amended soils has shown that metals solubility is influenced to a greater extent by cation exchange capacity and organic matter content than by pH, and that metals in biosolids are complexed with organic compounds which greatly reduces solubility and inhibits migration from the treatment zone. As a result, the Discharger reports that they do not anticipate substantial metals migration at the reduced pH. In order to assess whether the pH reduction is increasing the solubility of metals, the Discharger proposes to monitor metals concentrations in the infiltrate (leachate) and perform an annual trend analysis. Order 5-01-263 approved a reduced DLD soil pH limit of 5.0, but allowed Executive Officer to require an increase in the DLD soil pH if Regional Board staff finds that the trend in soluble metals concentrations in the leachate is increasing. This Order continues this requirement. Trend analysis results shall be reported in the annual monitoring report, per MRP R5-2015-0133.

Closure of DLDs 1 and 5

74. The Discharger closed C-DLDs 1 and 5 to address groundwater impacts from the unlined DLDs in 2004.
75. Closure requirements for Land Treatment Units are given in §21420 of Title 27, which states:

“During the closure and post-closure period, the discharger shall:

- (1) continue all operations necessary to maximize degradation, transformation, or immobilization of waste constituents within the treatment zones;*
- (2) continue all ground water and unsaturated zone monitoring in compliance with Article 1, Subchapter 3, Chapter 3, Subdivision 1 of this division (§20380 et seq);*
- (3) continue all operations of the treatment zones to prevent runoff of waste constituents; and*
- (4) maintain the precipitation and drainage control systems.”*

The Class II performance standard is given in §20310(a) of Title 27, which states:

“Class II waste management units (Class II “Units”) shall be designed and constructed to prevent migration of wastes from the Units to adjacent geologic materials, ground water, or surface water, during disposal operations, closure, and the post-closure period.”

The closure requirements given by this Order for C-DLDs 1 and 5 are intended to meet the LTU closure requirements given in §21420 of Title 27 and the performance standard given in §20310(a) of Title 27.

76. The Discharger submitted a Final Closure and Post-Closure Maintenance Plan for the C-DLDs 1 and 5 in December 2002, pursuant to Title 27 §21769.
77. The December 2002 amended ROWD submitted by the Discharger states that the proposed closure for DLDs 1 and 5 is an engineered alternative to the prescriptive requirements of Title 27. Title 27 provides a prescriptive requirement for closure of solid waste landfills under §21090; however, Title 27 does not provide a prescriptive requirement for closure of a land treatment unit. Despite this, the Discharger provided a demonstration in the amended ROWD showing that the proposed closure for DLDs 1 and 5 meets or exceeds the performance of a prescriptive final cover for a solid waste landfill as would be required under §20080 for an engineered alternative to the prescriptive requirement. This demonstration provides the required information for the closure requirements for LTUs pursuant to §21420 of Title 27 quoted in Finding 75, above.
78. A stability analysis was not provided for the C-DLDs because the closed DLD final cover slopes are less than 3H:1V.
79. The Discharger closed C-DLDs 1 and 5 using an evapotranspirative (ET) cover and lined the runoff zones using a 45-mil polypropylene liner as described in Findings 70 and 71. The ET cover consisted of vegetating existing DLD 1 and 5 soils. The cover was graded to drain by increasing existing slopes to a nominal 1 percent (%). Runoff from the final cover would continue to be captured and routed to the treatment plant headworks. The primary mechanism of an ET cover for minimizing infiltration of rainwater is uptake of moisture by evaporation and plant transpiration. The vegetation for the final cover originally consisted of a mixture of various grasses and forbs listed in Table 7 and was changed in 2012 (See Finding 86).

Table 7 – C-DLD Cover System Vegetation Plant Species

Common Name	Scientific Name	Persistence
Triticale	Triticum aestivum X Secale cereal	Annual
Creeping red fescue	Festuca rubra ssp. Rubra	Perennial
California brome	Bromus carinatus	Perennial
California barley	Hordeum californicum	Perennial
Purple needlegrass	Nassella pulchra Stipa pulchra	Perennial
Tall wheatgrass	Agropyron elongatum Elytrigia pontica	Perennial
Blue wildrye	Elymus glaucus	Perennial
Perennial ryegrass	Lolium perenne	Perennial

80. The final grading design for DLDs 1 and 5 utilized a “saw-tooth” design to provide the nominal 1% slope for drainage. The general objectives for development of the final grading design as stated by the Discharger are:
 - a. Minimize infiltration to reduce contaminant migration;
 - b. Promote runoff and prevent ponding;
 - c. Control erosion; and
 - d. Comply with applicable regulations.
81. The Discharger performed computer modeling to predict how much infiltration would pass through the 10-foot treatment zone at DLDs 1 and 5 after they are closed with the proposed final cover. The Discharger used geological and constituent concentration data in the modeling that was collected from four soil borings advanced at DLDs 1 and 5 during 2001. The geology and constituent concentrations were known at several depth intervals both within and beneath the 10-foot treatment zone. The infiltration performance was estimated using the UNSAT-H computer program. Input parameters included 30 years of rainfall data during the wettest 30-year period (1954-1983), vegetation data, and soil property data. Infiltration at the bottom of the treatment zone (10-foot depth) was calculated to be 0.008 centimeters per year (cm/yr). For comparison, the Discharger also modeled the performance of a Title 27 prescriptive final cover for a landfill. The predicted infiltration for this cover was 0.6 cm/yr. Finally, the Discharger estimated that the infiltration for DLDs 1 and 5 during historical operations was 13.4 cm/yr.
82. The Discharger also performed computer modeling to predict the impact to groundwater that would result from the predicted infiltration through the proposed final cover. The Discharger used the MULTIMED computer program. The modeling predicted no impacts

to groundwater at the point-of-compliance (downgradient edge of the units) through a period of 5,000 years.

83. The DLD soil monitoring conducted by the Discharger indicates high levels of nitrate as nitrogen, especially in the upper 2 to 3 feet. Nitrate as nitrogen has been the primary constituent-of-concern to drive corrective action activities at the facility due to high concentrations in the waste, and groundwater impacts above the primary maximum contaminant level of 10 milligrams per liter. The Discharger predicted that significant denitrification of the DLD soils will occur in the first several years after closure. Water quality data from eight lysimeters set at depths of 10 and 15 feet below the ground surface at the four monitoring stations showed that the constituent concentrations (nitrate, phosphate, sulfate, chloride, and electrical conductivity) remained relatively stable since the DLD 1 and 5 ET covers were installed in 2004, as detailed in the 2010 Action Level Report.
84. The Discharger predicted that the vegetation planted directly in the C-DLD soils will uptake salts and nitrates. The Discharger annually harvests and removes the vegetation. The purpose of the harvesting is to permanently remove salts and nitrates from the DLD soils, thereby reducing their threat to water quality. The Discharger conducts annual plant tissue analyses on the harvested biomass to determine the available disposal or beneficial reuse options. The Discharger has estimated that approximately 60,000 pounds of dry biomass material is removed from each C-DLD annually.
85. A plant community assessment in 2008 revealed that most of the existing plants were not those originally planted during closure. Only two of the original eight plant species (Table 7) were identified on the C-DLDs. Additionally, observations within 6 test pits showed that a majority of the root depths fell in the top 6 inches of soil, with the Tall Wheat Grass having the deepest roots at 17 inches. The shallow root depths cannot pull moisture from deeper soils in the ET cover. Furthermore, in 2010, an additional vegetation survey indicated that only 4% of the vegetation consisted of the original plant species.
86. The Discharger utilized two different seed mixes to reseed two 10-acre test plots to revegetate C-DLDs 1 and 5 final cover from fall 2010 through spring 2011. Based on the results of test plots, the remaining C-DLD cover areas were revegetated in November 2012 with a seed mix composed of Tall wheatgrass, Perennial rye, California brome, and Slender wheatgrass. The Discharger established the target vegetative cover through the application of broadleaf specific herbicides to reduce competition with broadleaf weeds and utilized haying practices (cutting, baling and removing) to promote the target perennial grass species while discouraging less desirable annual grasses and broadleaf weeds.
87. A May 2013 vegetation survey indicated healthy seed germination and substantial first season growth. During a subsequent vegetation survey in June 2014, roots were

observed throughout the test pits to depths of 37-inches and 48-inches. Additionally, the percent cover of target species in C-DLDs 1 and 5 were 108% and 60%, respectively. The June 2014 vegetation report concluded that the high absolute percent cover of target species achieved in less than 2 years following the reseeding effort is encouraging. The Discharger will continue weed control measures at C-DLDs 1 and 5 to reduce the occurrence of non-target species. Based on the results of the assessments, the Discharger will continue using the plant species listed in Finding 86 (Tall wheatgrass, Perennial rye, California brome, and Slender wheatgrass) and regularly inspecting the C-DLDs to remove non-target plant species for the C-DLDs 1 and 5 cover systems.

88. During the initial 8-years after closure, the Discharger collected data to determine the performance of the closure after the vegetative cover had been fully established. The Discharger proposed to develop action levels for infiltration and contaminant migration that would be used to determine when mitigation measures might be required to further reduce contaminant migration.
89. The Discharger submitted an *Action Level Report for DLD Units 1 and 5* in February 2010. The report concluded that it was not possible to correlate the neutron probe data with the soil core measurements due to an unexpectedly high degree of heterogeneity of the soil and recommended an additional 3 year monitoring period to further assess the final cover performance to develop the Final Action Levels. Staff approved the request for extended monitoring in a letter dated 14 September 2010.
90. The Discharger submitted a *Final Action Level Report for DLD Units 1 and 5* in July 2013 proposing to calculate water storage within the upper 15 feet of the waste in each DLD and compare the estimated water storage values to the proposed Final Action Levels. The proposed Final Action Levels consisted of the 95% percent upper tolerance limits of the 2010 to 2013 water storage estimates within the upper 15 feet of the waste. In a letter dated 16 August 2013, staff were concerned that the proposed methodology does not have a mechanism for monitoring contaminant migration. These WDRs require the Discharger to prepare a Revised Final Action Level Report that addresses contaminant migration, as detailed in Provision H.
91. The Final Post-Closure Monitoring Report submitted by the Discharger specifies monitoring of the performance of the DLD closure during the post-closure maintenance period. The current Final Post-Closure Monitoring Report specifies monitoring that consists of monitoring:
 - a. Two monitoring points installed at C-DLD 1 and C-DLD 5 (four total). Each monitoring station would also include two suction lysimeters to monitor soil pore liquid installed to depths of 10 and 20 feet bgs.
 - b. C-DLD soil moisture at various depths using neutron probe logging in the upper 20 feet.

Based on subsequent information submitted by the Discharger the proposed method to monitor the closure cover by utilizing neutron probes is unreliable because of the high degree of heterogeneity of the soil. Current closure C-DLD monitoring consists of collecting C-DLD soil samples semi-annually at each monitoring station for laboratory analysis of moisture. These WDRs require the Discharger to revise the Final Post-Closure Maintenance Plan with the updated post-closure monitoring system and the Revised Final Action Levels, as detailed in Provision H.

92. The Discharger submitted a document entitled Mitigation Alternatives for Closure Design (Mitigation Plan) in Appendix G of the December 2002 amended ROWD. This document proposes ways to mitigate problems with the closure of DLDs 1 and 5 from failure to establish adequate vegetation, destruction of vegetation by fire, and unfavorable soil chemistry. Proposed mitigation measures include planting of salt tolerant woody species and addition of organic matter to soil. This Order requires the Discharger to implement the mitigation measures proposed in the Mitigation Plan if the C-DLD vegetation is inadequate. The Discharger shall report in the adequacy of the C-DLD vegetation in the annual monitoring report, per MRP R5-2015-0133.

CLEAN CLOSURE AND CLOSURE FINANCIAL ASSURANCES

93. The Discharger proposes to clean-close the SSBs, provide an ET closure cover for the L-DLDs, continue post-closure monitoring for C-DLDs 1 and 5, provide post-closure monitoring for the L-DLDs when closed, and continue post-closure monitoring for the closed landfill, as detailed in the 2015 Annual Closure Plan Updates. The Discharger may clean-close all or a portion of the closed landfill as part of the EchoWater Project, and will revise the financial assurances as appropriate.
94. An itemized cost estimate for third party costs to clean-close the SSBs, provide a closure cover for the L-DLDs 2 to 4, provide post-closure monitoring for the C-DLDs and L-DLDs, and continue post-closure monitoring for the closed landfill is included in the 2015 Closure Plan Updates. The total of the estimate is \$23,267,184 in 2015 dollars, as shown on the table below. This cost estimate is approved by the adoption of these WDRs. Pursuant to Title 27 Section 22207(a), this Order requires the Discharger to establish financial assurances for these activities, with exception of the SSBs, in accordance with the approved cost estimate naming the Central Valley Water Board as the beneficiary. The SSBs are exempt from Title 27; however, this Order requires the Discharger to establish financial assurances for the clean-closure of the SSBs in accordance with the approved cost estimate naming the Central Valley Water Board as the beneficiary. The current balance of the Enterprise Fund mechanism for closure and post-closure is \$8,343,897. The landfill and C-DLD post-closure costs are fully funded. Annually the Discharger makes minimum payments to the Enterprise Fund for the SSB closure and L-DLD closure and post-closure equal to the closure and post-closure cost estimate divided by the active life of the SSBs and L-DLDs that is estimated to be 50 years. The Enterprise Fund will be fully funded for SSB closure and L-DLD closure and post-closure at the end of the estimated active life of the SSBs and L-DLDs.

Table 8 – 2015 Financial Assurances Estimate

Unit	Activity	2015 Dollars
Solids Storage Basins	Clean Closure	\$10,379,891
Lined Dedicated Land Disposal Units 2 to 4	Closure Evapotranspirative Cover	\$1,655,255
Lined Dedicated Land Disposal Units 2 to 4	Post-Closure (including groundwater CAP)	\$9,560,808
Closed Dedicated Land Disposal Units 1 and 5	Post-Closure	\$1,570,266
Closed Class III Landfill	Post-Closure	\$100,964
Total	Closure and Post-Closure	\$23,267,184

FINANCIAL ASSURANCES FOR CORRECTIVE ACTION

95. Title 27 section 22222 requires the Discharger to establish financial assurances for corrective action of a known or reasonably foreseeable release. A cost estimate for corrective action was submitted on 7 March 1995 to account for groundwater impacts from a release from a treatment unit and a limited release from a dike. The total cost estimate for corrective action is \$2,199,695 in 2015 dollars. The existing Enterprise Fund for corrective action costs is fully funded. The costs associated with operations and maintenance of the existing groundwater corrective action program associated with the DLDs is included in the L-DLD post-closure cost estimate. This cost estimate is approved by the adoption of these WDRs. This Order requires the Discharger to establish financial assurances for corrective action in accordance with the approved cost estimate naming the Central Valley Water Board as the beneficiary. This Order also requires annual adjustments to account for inflation by 1 June of each year.

CEQA AND OTHER CONSIDERATIONS

96. The action to revise WDRs for these waste management facilities is exempt from the provisions of the California Environmental Quality Act (CEQA), Public Resource Code section 21000, et seq., and the CEQA guidelines, in accordance with Title 14, section 15301.
97. The County of Sacramento, Department of Environmental Review determined the project for closure of DLDs 1 and 5 to be Categorical Exempt from the provisions of CEQA. A Notice of Exemption dated 14 January 2003 for the closure project was filed with the County of Sacramento County Clerk. A copy of the Notice of Exemption has been placed in the December 2002 amended Report of Waste Discharge submitted by the Discharger.

98. This order implements:

- a. *The Water Quality Control Plan for the Sacramento River and San Joaquin River Basins, Fourth Edition*
- b. The prescriptive standards and performance goals of California Code of Regulations, Title 27, section 20005 et seq., effective 18 July 1997, and subsequent revisions.

99. Based on the threat and complexity of the discharge, the facility is determined to be classified 1-A as defined below:

- a. Category 1 threat to water quality, defined as, "Those discharges of waste that could cause the long-term loss of a designated beneficial use of the receiving water. Examples of long-term loss of a beneficial use include the loss of drinking water supply, the closure of an area used for water contact recreation, or the posting of an area used for spawning or growth of aquatic resources, including shellfish and migratory fish."
- b. Category A complexity, defined as, "Any discharge or toxic wastes; any small volume discharge containing toxic waste; any facility having numerous discharge points and groundwater monitoring; or any Class 1 waste management unit."

100. Water Code section 13267(b)(1) provides that, in part: "In conducting an investigation specified in subdivision (a), the Regional Board may require that any person who has discharged, discharges, or is suspected of having discharge or discharging, or who proposes to discharge waste within its region, or any citizen or domiciliary, or political agency or entity of this state who has discharged, discharges, or is suspected of having discharged or discharging, or who proposes to discharge waste outside of its region that could affect the quality of the waters of the state within its region shall furnish, under penalty of perjury, technical or monitoring program reports which the board requires. The burden, including costs of these reports, shall bear a reasonable relationship to the need for the reports and the benefits to be obtained from the reports..."

101. The technical reports required by this Order and the attached "Monitoring and Reporting Program R5-2015-0133" are necessary to assure compliance with these waste discharge requirements. The Discharger owns and operates the facility that discharges the waste subject to this Order.

PROCEDURAL REQUIREMENTS

102. All local agencies with jurisdiction to regulate land use, solid waste disposal, air pollution, and to protect public health have approved the use of this site for the discharges of waste to land stated herein.

103. The Central Valley Water Board notified the Discharger and interested agencies and persons of its intent to prescribe waste discharge requirements for this discharge, and

has provided them with an opportunity for a public hearing and an opportunity to submit their written views and recommendations.

104. The Central Valley Water Board, in a public meeting, heard and considered all comments pertaining to the discharge.

IT IS HEREBY ORDERED, pursuant to California Water Code sections 13263 and 13267, that Order R5-2003-0076 is rescinded except for purposes of enforcement, and that Sacramento Regional County Sanitation District, their agents, successors, and assigns, in order to meet the provisions of Division 7 of the California Water Code and the regulations adopted thereunder, shall comply with the following:

A. PROHIBITIONS

General Prohibitions

1. The discharge of 'hazardous waste' is prohibited. For the purposes of this Order, the term 'hazardous waste' is as defined in California Code of Regulations, Title 23, section 2510 et seq.
2. The discharge of solid waste or liquid waste to surface waters, surface water drainage courses, or groundwater is prohibited.
3. The discharge of wastes outside of a waste management unit or portions of a waste management unit specifically designed for their containment is prohibited.
4. The discharge of wastes which have the potential to reduce or impair the integrity of containment structures or which, if commingled with other wastes in the units, could produce violent reaction, heat or pressure, fire or explosion, toxic by-products, or reaction products which in turn:
 - a. require a higher level of containment than provided by the unit,
 - b. are 'restricted hazardous wastes', or
 - c. impair the integrity of containment structures, is prohibited.
5. The Discharger shall comply with all Standard Prohibitions listed in Section C of the SPRRs dated November 2013. Provision H.1 references the SPRRs in entirety. Violation of Section C of the SPRRs constitutes being out of compliance with Prohibition A.5 and not Provision H.1.

Closed Class III Landfill

6. The discharge of new waste to the landfill is prohibited.

Unclassified Solids Storage Basins

7. The bypass and over flow of waste discharged to the SSBs, prior to being discharged to the L-DLDs, is prohibited.

Class II Dedicated Land Disposal Units

8. The discharge of waste in any form to the L-DLDs when the soil is saturated is prohibited.
9. The discharge of 'non-hazardous solid waste', including screenings and grit, not associated with the biosolids disposal operation, to the DLDs is prohibited. For the purposes of this Order, the term 'non-hazardous solid waste' is as defined in Title 27.
10. The discharge of wastes to C-DLDs is prohibited unless the biosolids and other waste materials are removed from the C-DLD and a liner is installed to convert the C-DLD to a L-DLD as detailed in Specification D.

B. DISCHARGE SPECIFICATIONS

General Specifications

1. The discharge shall not cause a condition of pollution or nuisance as defined by Water Code section 13050.
2. Prior to the discharge of waste to a Class II waste management unit, all wells within 500 feet of the unit shall have sanitary seals or shall be properly abandoned. A record of the sealing and/or abandonment of such wells shall be sent to the Central Valley Water Board and to the State Department of Water Resources.
3. The Discharger shall comply with all Standard Discharge Specifications listed in Section D of the SPRRs dated November 2013. Provision H.1 references the SPRRs in entirety. Violation of Section D of the SPRRs constitutes being out of compliance with Discharge Specification B.3 and not Provision H.1.

Unclassified Solids Storage Basins

1. The discharge of liquid and semi-solid waste to the SSBs is limited to digested sludge, secondary effluent from the Regional Plant, filtrate/centrate, thickener effluent, return flow from the BRF and freshwater. However, chemicals for treatment or other wastes may be discharged to the SSBs after written approval by the Executive Officer.
2. Operation of the SSBs shall not result in odor nuisance conditions and shall not result in the degradation of underlying groundwater.

Class II Dedicated Land Disposal Units

3. Biosolids injected on the L-DLDs shall be covered within 24-hours after application if it poses an odor and/or vector nuisance.
4. If odor conditions result from discing at the L-DLDs, discing shall be discontinued until the disposal units sufficiently dry and/or critical odor transport conditions are no longer present.
5. The pH of the zone of incorporation (the upper 5 feet) of the L-DLDs shall be maintained at or above 5.0 pH units. The pH limit may be increased by the Executive Officer if Regional Board staff finds that the concentration of dissolved metals is increasing in the DLD leachate.

C. FACILITY SPECIFICATIONS

General Specifications

1. Annually, prior to the anticipated rainy season but no later than **15 November**, any necessary construction, maintenance, or repairs of precipitation and drainage control facilities shall be completed and reported in compliance with MRP R5-2015-0133.

Unclassified Solids Storage Basins

2. The SSBs shall have capacity for wastewater flows to the SSBs, precipitation, and precipitation runoff from a 100-year wet year of 32.1 inches distributed monthly in accordance with historical rainfall patterns, and shall maintain at least two (2.0) feet of freeboard at all times, except during harvest operations. During harvest operations the Discharger shall maintain at least 1.5 feet of freeboard in the SSBs.
3. The Discharger shall **immediately** notify Central Valley Water Board staff by telephone and email and **immediately** take measures to regain SSB capacity in the event that freeboard levels are equal to or less than 2.0 feet during normal operations or 1.5 feet during harvest operations.
4. Any direct-line discharge to a SSB shall have fail-safe equipment or operating procedures to prevent overfilling.
5. The SSBs shall be designed, constructed and maintained to prevent scouring and/or erosion of the liners and other containment features at points of discharge to the impoundments and by wave action at the water line.
6. Solids that accumulate in the SSBs shall be periodically removed to maintain minimum freeboard requirements and to maintain sufficient capacity for supernate and the

discharge of wastes. Prior to removal of these solids, samples shall be collected for their characterization and classification in compliance with MRP R5-2015-0133.

Class II Dedicated Land Disposal Units

7. The Discharger shall operate and maintain the DLDs to maximize the degradation, transformation, and immobilization of waste constituents.
8. The surface of the DLDs shall be graded, smooth and free from significant depressions to encourage runoff and to prevent ponding.
9. DLD runoff zones shall be provided with a minimum 45-mil polypropylene geomembrane (or other equivalent) liner prior to any restriction or control gate closure that would detain storm water in the runoff zone.
10. The gates that control flow out of the DLD runoff zones shall not be closed except in an emergency situation as described in Finding 71 and shall be immediately opened once the emergency situation has passed.
11. Testing of the LCRS in each L-DLD shall be conducted annually to demonstrate that the LCRS is not clogged and is capable of transmitting all leachate to the sump. Results of the testing shall be reported in the Annual Monitoring Report as specified in MRP R5-2015-0133.
12. Each L-DLD pan lysimeter shall be monitored in accordance with MRP R5-2015-0133.
13. If liquids detected in a L-DLD pan lysimeter are determined to be from a leak in the containment structures, the Discharger shall:
 - a. **Immediately** notify Central Valley Water Board staff by telephone and email that the containment structures have failed.
 - b. **Immediately** stop biosolids applications on the side of the L-DLD associated with that lysimeter until the leak is repaired.
 - c. Remove liquid from the pan lysimeter on a regular basis until the repairs are completed.
 - d. **Immediately** sample and test the liquid in accordance with the unsaturated zone monitoring requirements in MRP R5-2015-0133.
 - e. Submit written notification of the release to Central Valley Water Board staff within **seven days** including a time schedule to repair the containment structures.
 - f. Complete repairs of the containment structures in accordance with the approved time schedule.

14. In the event that liquid detected in any pan lysimeter is shown to be leachate by comparison with liquids in the sump, then biosolids applications shall cease on the side of the L-DLD associated with that lysimeter until the leak is repaired. The liquid shall be removed from the pan lysimeter on a regular basis until the repairs are completed. An Evaluation Monitoring Program shall also be prepared in accordance with the Standard Provisions and Reporting Requirements to assess whether the release has impacted the underlying unsaturated zone or groundwater.
15. The Discharger shall comply with all Standard Facility Specifications listed in Section E of the SPRRs dated November 2013. Provision H.1 references the SPRRs in entirety. Violation of Section E of the SPRRs constitutes being out of compliance with Facility Specification C.15 and not Provision H.1.

D. DESIGN AND CONSTRUCTION SPECIFICATIONS

General Specifications

1. Containment structures and precipitation and drainage control systems shall be constructed and maintained to prevent, to the greatest extent possible, inundation, erosion, slope failure, and washout under 1,000-year, 24-hour precipitation conditions for Class II waste management units and 100-year, 24-hour precipitation conditions for Class III waste management units.
2. Waste management units shall be designed, constructed and operated to prevent inundation or washout due to flooding events with a 100-year return period.
3. Surface drainage from wastewater treatment plant tributary areas and wastewater treatment plant internal site drainage from surface or subsurface sources shall not contact or percolate through wastes.
4. The Discharger shall comply with all Standard Construction Specifications listed in Section F of the SPRRs dated November 2013. Provision H.1 references the SPRRs in entirety. Violation of Section F of the SPRRs constitutes being out of compliance with Design and Construction Specification D.4 and not Provision H.1.
5. The Discharger shall comply with all Storm Water Provisions listed in Section L of the SPRRs dated November 2013. Provision H.1 references the SPRRs in entirety. Violation of Section L of the SPRRs constitutes being out of compliance with Design and Construction Specification D.5 and not Provision H.1.

Unclassified Solids Storage Basins

6. This Order allows modification to the SSBs to implement BPTCs following written Executive Officer approval of a design report including plans, specifications, and a construction quality assurance plan.

Class II Lined Dedicated Land Disposal Units

7. C-DLDs 1 and 5 may be converted to active L-DLDs using similar procedures to L-DLD 2 to 4 as detailed in Finding 67. Prior to lining a DLD, the Discharger shall excavate existing biosolids, waste materials, and native soil to a minimum depth of five-feet. Unless analytical testing results prove otherwise, the materials excavated from C-DLD 5 are considered designated waste and must be handled accordingly. Excavated materials removed from the C-DLD 5 footprint shall be stored in a Lined DLD (L-DLD 2, 3, or 4). Detailed excavation and stockpile plans shall be included in the design plans. Excavation of C-DLDs will proceed only after all applicable design plans, specifications, and construction quality assurance plans have been approved by Executive Officer.
8. Subgrade soils 1-foot below the liner system shall consist of fine-grained soils with significant clay content that are SC, CL or CH per the Unified Soil Classification System. Visual classification of the subgrade shall be conducted on a 100-foot horizontal grid. Any area of soil that was not classified as SC, CL or CH shall be excavated to a depth of one-foot and replaced by fine-grained clayey soils.
9. The DLD liner systems shall be constructed, at a minimum, with components listed below, from top to bottom:
 - a. an LCRS consisting of 12-inches of 3/8-inch pea gravel, filter fabric and drainage piping;
 - b. a 60-mil HDPE geomembrane;
 - c. 1-foot thick layer of clayey soils that have been moisture conditioned and compacted;
 - d. LCRS sumps and sump pumps; and
 - e. two pan lysimeters underlying pipe penetrations of the liner which are the lowest points in the LCRS.

10. The LCRS for the L-DLDs shall be designed, constructed, and maintained to transmit twice the maximum anticipated daily volume of leachate to the sump without clogging and to prevent the buildup of hydraulic head on the underlying liner at any time. The LCRS pump shall be capable of removing this volume of leachate.
11. The depth of the fluid in any LCRS sump shall be kept at the minimum needed for safe pump operation without excessive pump cycling that could damage the pump.
12. Materials used to construct LCRSs shall have appropriate physical and chemical properties to ensure the required transmission of leachate over the life of the surface impoundments and the post-closure maintenance period.
13. Materials used to construct liners shall have appropriate physical and chemical properties to ensure containment of discharged wastes over their operating life.
14. DLD runoff zones shall be lined with a minimum 45-mil polypropylene liner during construction of DLD liner systems or during closure of unlined DLDs, as applicable.
15. The receiving surface for the HDPE layer of the DLD liner systems shall be flat rolled to be smooth and shall be free from significant organic material or any stones that protrude above the surface.
16. The Discharger may propose changes to the liner system design prior to construction, provided that approved components are not eliminated, and the engineering properties of the components are not substantially reduced. The proposed changes may be made following written approval by the Executive Officer.
17. The construction of the L-DLDs shall be under the direct supervision of a California registered civil engineer or certified engineering geologist.
18. The Discharger shall submit a design report including plans, specifications, and a construction quality assurance plan for review and approval prior to constructing any new L-DLD.
19. The Discharger shall submit a Construction Quality Assurance (CQA) Plan to the Regional Board for approval by Regional Board staff at least 90-days prior to construction of any L-DLDs. The CQA Plan shall include specifications for moisture conditioning and compaction of the soil underlying the HDPE geomembrane layer as well as minimum testing requirements.
20. Following the completion of construction of a L-DLD or portion of a L-DLD, and prior to discharge onto the newly constructed liner system, the final documentation required in §20324(d)(1)(C) of Title 27 shall be submitted to the Regional Board for review and approval. The report shall be certified by a California registered civil engineer or a

certified engineering geologist. It shall contain sufficient information and test results to verify that construction was completed in accordance with the design plans and specifications, with the requirements of this Order, and with the performance goals of Title 27.

21. A third party independent of both the Discharger and the construction contractor shall perform all of the construction quality assurance monitoring and testing during the construction of a liner system.
22. Closure of L-DLDs shall only proceed after adoption of closure waste discharge requirements that include findings and specifications that are written in accordance with the Discharger's demonstration that the proposed closure method will protect water quality.

E. CLOSURE AND POST-CLOSURE MAINTENANCE SPECIFICATIONS

General Closure Specifications

1. The closure of the waste management facilities, including the SSBs and DLDs, shall be under the direct supervision of a California registered civil engineer or certified engineering geologist.
2. The closure of each unit of all facilities shall be provided with at least two permanent monuments, installed by a licensed land surveyor, from which the location and elevation of all wastes, containment structures, and monitoring facilities can be determined throughout the post-closure maintenance period.
3. The Discharger shall continue to monitor groundwater and the vadose zone per MRP R5-2015-0133 throughout the post-closure maintenance period.
4. The post-closure maintenance period shall continue until the Regional Board determines that remaining wastes in the DLDs, landfill, and SSBs do not threaten water quality.

Class III Landfill Closure and Post-Closure Maintenance

5. The closed landfill shall be maintained with a final cover consisting, at a minimum, of a two-foot thick foundation layer which may contain waste materials, overlain by a one-foot thick clay cover that has an hydraulic conductivity of no more than 1×10^{-6} cm/sec, and finally by a one-foot thick vegetative soil layer.
6. Vegetation shall be maintained over the closed landfill. Vegetation shall be selected to require a minimum of irrigation and maintenance and shall have a rooting depth not in excess of the vegetative layer thickness.

7. The closed landfill shall be graded to at least a three percent grade and maintained to prevent ponding.
8. Landfill gas monitoring shall be conducted per CalRecycle and the Local Enforcement Agency requirements. Copies of the landfill gas monitoring reports shall be submitted to the Regional Board with the annual monitoring reports as specified in MRP R5-2015-0133.
9. The Discharger may submit a work plan to clean-close the landfill for Regional Board approval pursuant to Title 27, Section 21090(f). Clean-closure may only proceed following written approval by the Executive Officer.
10. The Discharger shall comply with all Closure and Post-Closure Maintenance Specifications listed in Section G of the SPRRs dated November 2013. Provision H.1 references the SPRRs in entirety. Violation of Section G of the SPRRs constitutes being out of compliance with Closure and Post-Closure Maintenance Specification E.10 and not Provision H.1.

Unclassified Solids Storage Basins

11. At closure of the SSBs, the Discharger shall clean-close the SSBs. All residual wastes, including liquids, sludges, precipitates, settled solids, liner materials and adjacent natural geological materials contaminated by wastes shall be completely removed and discharged to an appropriately permitted landfill facility. If after reasonable attempts to remove contaminated natural geologic materials, the Discharger demonstrates that removal of all remaining contamination is infeasible, then the units shall be closed as a landfill. In this event, the Discharger shall backfill and grade the area and submit a revised Final Closure and Post-Closure Maintenance Plan proposing a final cover meeting the requirements of Title 27 section 21090 and shall perform all post-closure maintenance in the approved Post-Closure Maintenance Plan.
12. The Discharger shall submit a work plan for clean-closure of the SSBs a minimum of 90 days prior to clean-closure of the SSBs for Executive Officer approval.

Class II Dedicated Land Disposal Units

13. At closure and during post-closure period for the DLDs, the Discharger shall, pursuant to Title 27 section 21420, perform the following:
 - a. Install a final evapotranspirative cover system consisting of vegetating the existing DLD soils with a mixture of various grasses and forbs listed in Table 7 or Finding 86 (Tall wheatgrass, Perennial rye, California brome, and Slender wheatgrass). The Discharger may conduct pilot tests for different mixtures of grasses and forbs. Using plant species for the evapotranspirative cover other than

those listed in Table 7 or Finding 86 shall be approved by the Executive Office in writing prior to use.

- b. Continue all operations necessary to maximize degradation, transformation, or immobilization of waste constituents.
 - c. Continue all groundwater and unsaturated zone monitoring in compliance with the monitoring and reporting program.
 - d. Continue all operations to prevent runoff of waste constituents.
 - e. Maintain the precipitation and drainage control systems.
14. At closure, DLD slopes shall be graded to a nominal slope of one percent (1%) for drainage and shall tie into surface water collection swales nominally sloped at one-half percent (0.5%) or greater. Perimeter conveyance channels adjacent to the DLDs shall be sloped at a minimum two-tenths percent (0.2%).
15. At closure, DLDs shall receive vegetation that shall be selected to require a minimum of irrigation and maintenance, and that will maximize moisture uptake during the rainy season.
16. All vegetation shall be maintained over C-DLDs to maximize uptake of moisture in the DLD soils. The closure vegetation shall include the plant species listed in Table 7 of Finding 79 or Finding 86 (Tall wheatgrass, Perennial rye, California brome, and Slender wheatgrass).
17. Vegetation on C-DLDs shall be harvested at least **annually**. The Discharger shall conduct plant tissue analysis on the harvested biomass to determine the available disposal or beneficial reuse options. Disposal or reuse of plant biomass shall be in accordance with applicable regulatory requirements.
18. The Discharger shall maintain the final cover for C-DLDs and repair any areas of ponding.
19. Temporary construction activities associated with the EchoWater Project on C-DLD 1 include stockpiling soil and installing and maintaining a haul road for construction equipment. C-DLD 1 final cover materials may not be removed from C-DLD 1 during temporary construction operations. The Discharger shall continue to maintain C-DLD 1 during construction and repair any areas of ponding.
20. Temporary construction activities conducted on C-DLD 1 will be terminated at the completion of construction of the EchoWater Project. 90-days prior to the completion of the EchoWater Project, the Discharger shall submit a report documenting the methodologies to be implemented to restore the final cover on C-DLD 1 for approval by the Regional Board.

21. The Discharger shall perform the mitigation measures described in the *Mitigation Alternatives for Closure Design* (Mitigation Plan) in Appendix G of the December 2002 amended ROWD if any of the applicable conditions described in the Mitigation Plan are found to exist by either the Discharger or by Regional Board staff. The Discharger shall report in the adequacy of the C-DLD vegetation and if mitigation measures are required in the annual monitoring report, per MRP R5-2015-0133.
22. Prior to closure, the Discharger shall submit a Final Closure and Post-Closure Maintenance Plan prepared by a California-registered civil engineer or certified engineering geologist that contains all applicable information required in Title 27 section 21769. The plan shall include any closure/post-closure elements proposed in the ROWD, and shall meet the requirements of this Order.
23. The Discharger shall perform all post-closure maintenance activities specified in the facility's Final Closure and Post-Closure Maintenance Plans that are not specifically referred to in this Order.
24. The Discharger shall submit to the Regional Board an annual update of the Closure and Post-Closure Maintenance Plan by **1 June** each year.

F. FINANCIAL ASSURANCE

1. By **1 June 2016**, pursuant to Title 27 Section 22207, the Discharger shall submit a report showing that it has established an irrevocable **closure, post-closure fund** with the Central Valley Water Board named as beneficiary to ensure closure and post-closure of the Class II DLDs, and Class III landfill is in accordance with the cost estimate in the 2015 Closure Plan Update. The SSBs are exempt from Title 27; however, the Discharger shall continue to provide an irrevocable **closure** with the Central Valley Water Board named as beneficiary to ensure closure of the SSBs in accordance with the cost estimate in the 2015 Closure Plan Update. The financial assurances mechanism shall be one listed in Title 27 section 22228 for which the Discharger is eligible. For financial assurance mechanisms requiring funding, the Discharger shall either fully fund the mechanism by 1 June 2016 or may propose a payment schedule. If the Discharger proposes a payment schedule to fund the mechanism, it shall submit a report by **1 June 2016** showing that the mechanism is funded. If the Discharger continues to use the existing Enterprise Fund mechanism, the minimum annual deposit into the fund shall be equal to the current closure and/or post closure cost estimate(s) divided by the active life (in years) of the active waste management units, which is 50 years for the SSBs and L-DLDs. For financial assurance mechanisms not requiring funding, such as a Guarantee, the Discharger shall submit a report showing the mechanism is in place by **1 June 2016**.
2. By **1 June 2016**, pursuant to Title 27 section 22222, the Discharger shall submit a report showing that it has established an irrevocable **corrective action fund** with the Central Valley Water Board named as beneficiary to ensure funds are available to

address a known or reasonably foreseeable release from the Class II DLDs, and Class III landfill. The SSBs are exempt from Title 27; however, the Discharger shall continue to provide an irrevocable **corrective action fund** with the Central Valley Water Board named as beneficiary to ensure funds are available to address a known or reasonably foreseeable release from the SSBs. The financial assurances mechanism shall be one listed in Title 27 section 22228 for which the Discharger is eligible. For financial assurance mechanisms requiring funding, the Discharger shall either fully fund the mechanism by 1 June 2016 or may propose a payment schedule. If the Discharger proposes a payment schedule to fund the mechanism, it shall submit a report by **1 June 2016** showing that the mechanism is funded. For financial assurance mechanisms not requiring funding, the Discharger shall submit a report showing the mechanism is in place by **1 June 2016**.

3. By **1 June** of each year, the Discharger shall submit a report to the Central Valley Water Board that reports the balance of both the closure and corrective action funds or the amounts of the Guarantees and the adjustments to account for inflation in accordance with Title 27 section 22236.
4. The Discharger shall comply with all Standard Financial Assurance Specifications listed in Section H of the SPRRs dated November 2013. Provision H.1 references the SPRRs in entirety. Violation of Section H of the SPRRs constitutes being out of compliance with Financial Assurance F.4 and not Provision H.1.

G. MONITORING SPECIFICATIONS

1. The Discharger shall comply with the detection monitoring program provisions of Title 27 for groundwater, the unsaturated zone, and waste discharge in accordance with MRP R5-2015-0133, and the Standard Monitoring Specifications listed in Section I of the SPRRs dated November 2013.
2. The Discharger shall, for any waste management unit in a corrective action monitoring program, comply with the corrective action monitoring program provisions of Title 27, MRP R5-2015-0133, and the Standard Monitoring Specifications listed in Section I of SPRRs dated November 2013.
3. The Discharger shall comply with the Water Quality Protection Standard as specified in this Order, MRP R5-2015-0133, and the SPRRs dated November 2013.
4. The concentrations of the constituents of concern in waters passing the Point of Compliance (defined pursuant to Title 27, section 20164 as a vertical surface located at the hydraulically downgradient limit of the waste management unit that extends through the uppermost aquifer underlying the unit) shall not exceed the concentration limits established pursuant to MRP R5-2015-0133.
5. For each monitoring event, the Discharger shall determine whether the waste management unit is in compliance with the Water Quality Protection Standard using

procedures specified in MRP R5-2015-0133 and the Standard Monitoring Specifications in Section I of the SPRRs dated November 2013.

6. The corrective action monitoring program consists of sampling the extraction wells semi-annually as required in MRP R5-2015-0133.
7. The Discharger shall comply with all Standard Monitoring Specifications and Response to a Release specifications listed in Sections I and J of the SPRRs dated November 2013. Provision H.1 references the SPRRs in entirety. Violation of Sections I and J of the SPRRs constitutes being out of compliance with Monitoring Specification G.7 and not Provision H.1.

H. PROVISIONS

1. The Discharger shall comply with the Standard Provisions and Reporting Requirements, dated November 2013. The Standard Provisions and Reporting Requirements contain important provisions and requirements with which the Discharger must comply. A violation of any of the Standard Provisions and Reporting Requirements is a violation of these waste discharge requirements.
2. Pursuant to Water Code section 13267, the Discharger shall comply with Monitoring and Reporting Program R5-2015-0133, which is attached to and made part of this Order. This compliance includes, but is not limited to, maintenance of waste containment facilities and precipitation and drainage controls and monitoring groundwater, the unsaturated zone, and surface waters throughout the active life of the waste management units and any applicable post-closure maintenance period. A violation of Monitoring and Reporting Program R5-2015-0133 is a violation of these waste discharge requirements.
3. The Discharger shall not discharge waste to a new L-DLD (converted from C-DLD 1 or 5) until the following tasks are completed and approved by Central Valley Water Board staff:
 - a. Install a groundwater monitoring system.
 - b. Establish background groundwater quality through at least one year of monitoring (a minimum of 8 samples is required to develop statistical values for inorganic Constituents Of Concern (COCs)).
 - c. Submit a report proposing a Water Quality Protection Standard including a method for calculating concentration limits.
4. Prior to discharging waste to a new L-DLD (converted from C-DLD 1 or 5), the Discharger shall establish Financial Assurance funds for closure and corrective action.
5. The Discharger shall continue the operation the corrective action groundwater extraction system until the Discharger demonstrates that the concentrations of all

COCs are reduced to levels below their respective concentration limits throughout the entire zone affected by the release, per Title 27 Section 20430, and receives written authorization from the Executive Office to terminate corrective action.

6. The Discharger shall maintain a copy of this Order at the facility and make it available at all times to facility operating personnel, who shall be familiar with its contents, and to regulatory agency personnel.
7. The Discharger shall maintain legible records of the volume and type of waste discharged to the surface impoundments and the manner and location of the discharge. Such records shall be maintained at the facility until the beginning of the post-closure maintenance period. These records shall be available for review by representatives of the Central Valley Water Board and of the State Water Resources Control Board, copies of these records shall be sent to the Central Valley Water Board upon request.
8. The Discharger shall comply with all applicable provisions Title 27 that are not specifically referred to in this Order.
9. The Discharger shall, in a timely manner, remove and relocate any wastes discharged at this facility in violation of this Order and of the California Water Code.
10. The Discharger shall immediately notify the Central Valley Water Board of any flooding, equipment failure, slope failure, or other change in site conditions which could impair the integrity of waste or leachate containment facilities or precipitation and drainage control structures.
11. In the event of any change in control or ownership of the facility or disposal areas, the Discharger must notify the succeeding owner or operator of the existence of this Order by letter, a copy of which shall be immediately forwarded to this office. To assume operation as Discharger under this Order, the succeeding owner or operator must apply in writing to the Executive Officer requesting transfer of the Order. The request must contain the requesting entity's full legal name, the state of incorporation if a corporation, the name and address and telephone number of the persons responsible for contact with the Central Valley Water Board, and a statement. The statement shall comply with the signatory paragraph of General Provision K.2.e in the Standard Provisions and Reporting Requirements and state that the new owner or operator assumes full responsibility for compliance with this Order. Failure to submit the request shall be considered a discharge without requirements, a violation of the California Water Code. Transfer shall be approved or disapproved by the Executive Officer.
12. The Discharger shall provide proof to the Central Valley Water Board **within sixty days after completing final closure** of the Site that the deed to the facility property,

or some other instrument that is normally examined during title search, has been modified to include, in perpetuity, a notation to any potential purchaser of the property stating that:

- a. The parcel has been used for disposal of wastes.
- b. Land use options for the parcel are restricted in accordance with post-closure land uses set forth in any post-closure plan (if applicable).
- c. In the event that the Discharger defaults on carrying out either any corrective action needed to address a release, groundwater monitoring, or any post-closure maintenance (if applicable), then the responsibility for carrying out such work falls to the property owner.

13. All technical reports required herein that involve planning, investigation, evaluation, or design, or other work requiring interpretation and proper application of engineering or geologic sciences, shall be prepared by or under the direction of persons registered to practice in California pursuant to California Business and Professions Code sections 6735, 7835, and 7835.1. As required by these laws, completed technical reports must bear the signature(s) and seal(s) of the registered professional(s) in a manner such that all work can be clearly attributed to the professional responsible for the work.

14. The following reports shall be submitted pursuant to Section 13267 of the California Water Code and shall be prepared by a California-registered civil engineer or certified engineering geologist:

Task

Compliance Date

A. Construction Plans

Submit construction and design plans for review and approval. (see all Construction Specifications in Section D, above and Section F of the SPRRs.)

**90 days prior to
proposed construction**

B. Construction Report

Submit a construction report for review and approval upon completion demonstrating construction was in accordance with approved construction plans (see Standard Construction Specifications in Section F of the SPRRs).

**60 days prior to
proposed discharge**

15. All reports required by this Order shall be submitted pursuant to Water Code section 13267. The following reports shall be submitted pursuant to Section 13267 of the

California Water Code and shall be prepared by a California-registered civil engineer or certified geologist:

16. By **1 March 2016**, the Discharger shall submit a Sample Collection and Analysis Plan detailing the facility sampling and analysis procedures including quality assurance/quality control standards.
17. By **1 March 2016**, the Discharger shall submit a Water Quality Protection Standard (WQPS) Report describing the WQPS for each unit at the site for each monitored media under this Order (i.e., unsaturated zone, and groundwater). The WQPS report shall specify Constituents of Concentration, Concentration Limits, Monitoring Points, Points of Compliance, and Compliance Periods, per Title 27 §20390.

Unclassified Solids Storage Basins

18. By **1 January 2017** the Discharger shall submit an antidegradation analysis for the SSBs that includes:
 - a. Whether the discharge has caused degradation of high quality groundwater. If so, for which constituents, to what degree, and whether the discharge has caused exceedance of a water quality objective.
 - b. Characterization of all waste constituents to be discharged that have the potential to degrade groundwater quality.
 - c. Characterization of shallow and first aquifer groundwater quality for typical waste constituents¹ upgradient and downgradient of the site and comparison to established water quality objectives² (include tabulated historical groundwater monitoring data and groundwater elevation contour maps for the last eight monitoring events).
 - d. A description of the geology and hydrogeologic conditions of the site including groundwater elevation and gradient, transmissivity, influence of all known recharge and pumping sources, and subsurface conditions at the facility, including any proposed new disposal site or storage ponds.
 - e. Groundwater degradation, if any, that has resulted from existing operations, other nearby discharges, or natural occurrences.
 - f. The areal extent that the discharge has impacted or will impact the quality of the shallow groundwater, if any.

¹ Include analyses for the constituents of concern including, but not limited to: total dissolved solids, electrical conductivity, nitrate nitrogen, total nitrogen, and major anions and cations.

² Compare to Basin Plan water quality objectives, including narrative and numeric.

- g. If degradation has occurred or is expected to occur, describe the following:
- i. Any facility design features and operational practices that reduce the potential for groundwater degradation (treatment or control). Such features might include salinity source control, other pollutant source control, advanced treatment, disinfection, concrete treatment structures, and pond lining systems, etc.
 - ii. Additional treatment or control measures that could be implemented and a preliminary capital and annual operations and maintenance cost estimate for each.
 - iii. How current treatment or control measures are justified as Best Practicable Treatment or Controls;
 - iv. How no water quality objectives will be exceeded; and
 - v. Why allowing existing and/or anticipated degradation is to the maximum benefit to the people of the state.
19. If the antidegradation analysis concludes that the SSBs have degraded groundwater, the Discharger shall submit a corrective action work plan by **1 December 2017** detailing a plan and schedule to incorporate additional Best Practicable Treatment Controls to reduce degradation of groundwater.
20. By **1 September 2016**, the Discharger shall provide a report detailing how the Discharger will maintain a minimum two feet of freeboard within the SSBs, or 1.5 feet of freeboard during harvest operations, while containing flows from a 100-year wet year.

Class II Dedicated Land Disposal Units

21. The Discharger shall submit a Revised Final Action Level Work Plan for C-DLDs 1 and 5 by **1 July 2016**. The Work Plan shall describe the Discharger's proposed evaluation to determine Final Action Levels for the C-DLDs 1 and 5 cover systems that indicate when liquids may be infiltrating through the C-DLDs potentially transmitting contaminants to the groundwater.
22. The Discharger shall submit a Revised Final Action Level Report for C-DLDs 1 and 5 by **1 July 2017** that details the Discharger's evaluation, results, and final action levels for C-DLDs 1 and 5. The report shall include:
- a. A description of the C-DLD Final Action Level evaluation.
 - b. The C-DLD Final Action Level evaluation results.
 - c. Final Action Levels for C-DLDs 1 and 5.
 - d. C-DLDs semi-annual sampling procedures for comparison with the C-DLD Final Action Levels.

- e. Mitigation measures to be implemented if Final Action Levels are exceeded.
 - f. Mitigation measures to be implemented if it is determined that the C-DLD cover system is not performing.
 - g. Map showing sample locations, if applicable.
 - h. Tabulated laboratory results, if applicable.
 - i. Copies of laboratory reports, if applicable.
23. The Discharger shall submit a Revised Final Post-Closure Monitoring Report for C-DLDs 1 and 5 by **1 July 2017** with the updated post-closure monitoring system detailing sampling and analysis methods that are comparable to the final action levels.
24. In the event of any change in ownership of this waste management facility, the Discharger shall notify the succeeding owner or operator in writing of the existence of this Order. A copy of that notification shall be sent to the Central Valley Water Board.
25. The Central Valley Water Board will review this Order periodically and may revise requirements when necessary.
26. This Order shall take effect upon the date of adoption.
27. The Discharger shall comply with all General Provision listed in Section K of the SPRRs dated November 2013. Provision H.1 references the SPRRs in entirety. Violation of Section K of the SPRRs constitutes being out of compliance with Prohibition H.27 and not Provision H.1.

If, in the opinion of the Executive Officer, the Discharger fails to comply with the provisions of this Order, the Executive Officer may refer this matter to the Attorney General for judicial enforcement, may issue a complaint for administrative civil liability, or may take other enforcement actions. Failure to comply with this Order may result in the assessment of Administrative Civil Liability of up to \$10,000 per violation, per day, depending on the violation, pursuant to the Water Code, including sections 13268, 13350 and 13385. The Central Valley Water Board reserves its right to take any enforcement actions authorized by law.

Any person aggrieved by this action of the Central Valley Water Board may petition the State Water Board to review the action in accordance with Water Code section 13320 and California Code of Regulations, title 23, sections 2050 and following. The State Water Board must receive the petition by 5:00 p.m., 30 days after the date of this Order, except that if the thirtieth day following the date of this Order falls on a Saturday, Sunday, or state holiday, the petition must be received by the State Water Board by 5:00 p.m. on the next business day. Copies of the law and regulations applicable to filing petitions may be found on the Internet at:

http://www.waterboards.ca.gov/public_notices/petitions/water_quality

or will be provided upon request.

I, PAMELA C. CREEDON, Executive Officer, do hereby certify the foregoing is a full, true and correct copy of an Order adopted by the California Regional Water Quality Control Board, Central Valley Region, on 11 December 2015.

ORIGINAL SIGNED BY
PAMELA C. CREEDON, Executive Officer

AAH/WMH

CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD
CENTRAL VALLEY REGION

MONITORING AND REPORTING PROGRAM R5-2015-0133
FOR
SACRAMENTO REGIONAL COUNTY SANITATION DISTRICT
SACRAMENTO REGIONAL WASTEWATER TREATMENT PLANT
BIOSOLIDS AND SOLIDS STORAGE AND DISPOSAL FACILITIES
CLASS II LAND TREATMENT UNITS
UNCLASSIFIED SOLIDS STORAGE BASINS
CLASS III LANDFILL
CONSTRUCTION, CLOSURE, POST-CLOSURE MAINTENANCE, AND
CORRECTIVE ACTION
SACRAMENTO COUNTY

This monitoring and reporting program (MRP) is issued to Sacramento Regional County Sanitation District (Discharger) pursuant to California Water Code section 13267 and incorporates requirements for groundwater, surface water, and unsaturated zone monitoring and reporting; facility monitoring, maintenance, and reporting; and financial assurances reporting contained in California Code of Regulations, title 27, section 20005, et seq. (hereafter Title 27), Waste Discharge Requirements (WDRs) Order R5-2015-0133, and the Standard Provisions and Reporting Requirements dated November 2013 (SPRRs). Compliance with this MRP is ordered by the WDRs and the Discharger shall not implement any changes to this MRP unless a revised MRP is issued by the Central Valley Water Board or the Executive Officer. Failure to comply with this MRP, or with the SPRRs, constitutes noncompliance with the WDRs and with Water Code Section 13267, which can result in the imposition of civil monetary liability.

A. MONITORING

The Discharger shall comply with the detection monitoring program provisions of Title 27 for groundwater, surface water, and the unsaturated zone in accordance with Standard Monitoring Specifications in Section I of the SPRRs. All monitoring shall be conducted in accordance with a *Sample Collection and Analysis Plan*, which includes quality assurance/quality control standards. WDRs R5-2015-0133 requires the Discharger to submit a *Sample Collection and Analysis Plan* by 1 March 2016.

All compliance monitoring wells established for the detection monitoring program shall constitute the monitoring points for the groundwater Water Quality Protection Standard. All monitoring program groundwater monitoring wells, unsaturated zone monitoring devices, leachate, and waste discharge shall be sampled and analyzed for monitoring parameters and constituents of concern (COCs) as indicated and listed in Tables 1 through 7.

The Discharger shall use approved test methods with the lowest achievable detection limit for that constituent taking any matrix interferences into account. The reporting limit shall be no higher than the practical quantitation limit. The Discharger shall report all

trace concentrations that are between the detection limit and the practical quantitation limit. All metals analyses shall be for dissolved metals, with exception of the digested sludge (Section 5.a.i) and harvested sludge (Section 5.c.i) samples that are analyzed as a solid.

The monitoring program of this MRP includes:

<u>Section</u>	<u>Monitoring Program</u>
A.1	Groundwater Monitoring
A.2	Surface Water Monitoring
A.3	Unsaturated Zone Monitoring
A.4	LCRS Monitoring and Annual LCRS Testing
A.5	Waste Discharge Monitoring
A.6	Closed Class III Landfill Gas Monitoring
A.7	Facility Monitoring
A.8	Corrective Action Monitoring

1. Groundwater Monitoring

The Discharger shall operate and maintain a groundwater detection monitoring system that complies with the applicable provisions of Title 27, sections 20415 and 20420. The detection monitoring system shall be certified by a California-licensed professional civil engineer or professional geologist as meeting the requirements of Title 27. The current groundwater detection monitoring system meets the applicable requirements of Title 27.

The current groundwater monitoring network consists of the following:

<u>Well</u>	<u>Status</u>	<u>Zone</u>	<u>Area Being Monitored</u>
MW-219R	Background	Shallow	North Side
MW-220	Background	Shallow	North Side
MW-221R	Background	Shallow	North Side

MW-338	Detection	First Aquifer	South Side

Groundwater samples shall be collected semiannually from the background wells, detection monitoring wells, and any additional wells added as part of the approved groundwater monitoring system. Extraction wells shall be monitored as specified in Section A.8 for corrective action and are not part of the detection monitoring system. The Discharger shall collect, preserve, and transport groundwater samples in accordance with a Sample Collection and Analysis Plan. Depth to groundwater shall be measured to the nearest 0.01 feet. Samples shall be collected and analyzed for the monitoring parameters in accordance with the methods and frequency specified in the following table:

Table 1: Groundwater Monitoring			
<u>Parameters^{4,5}</u>	<u>Units</u>	<u>Monitoring</u>	<u>Reporting</u>
<u>Field Parameters</u>			
Groundwater Elevation	Feet & 100ths, M.S.L.	Quarterly	Semi-Annually
Temperature	°F	Semi-Annually	Semi-Annually
Specific Conductance	µmhos/cm	Semi-Annually	Semi-Annually
pH	Number	Semi-Annually	Semi-Annually
Turbidity	Turbidity units	Semi-Annually	Semi-Annually
<u>Monitoring Parameters</u>			
Total Dissolved Solids	mg/L	Semi-Annually	Semi-Annually
Chloride	mg/L	Semi-Annually	Semi-Annually
Nitrate as Nitrogen	mg/L	Semi-Annually	Semi-Annually
Arsenic	µg/L	Semi-Annually	Semi-Annually
Chromium	µg/L	Semi-Annually	Semi-Annually
<u>Constituents of Concern</u>			
Cadmium	µg/L	Annually	Annually
Calcium	mg/L	Annually	Annually
Copper	µg/L	Annually	Annually
Magnesium	mg/L	Annually	Annually
Potassium	mg/L	Annually	Annually
Total Alkalinity	mg/L	Annually	Annually
Total Kjeldahl Nitrogen	mg/L	Annually	Annually
Nickel	µg/L	Annually	Annually
Sodium	mg/L	Annually	Annually
Zinc	µg/L	Annually	Annually
Sulfate	mg/L	Annually	Annually
Nitrite as Nitrogen	mg/L	Annually	Annually
Inorganic Parameters ²	mg/L	5 Years	5 Years
Trace Metals ³	µg/L	5 Years	5 Years

¹ The Discharger shall measure the groundwater elevation in each well **quarterly**, determine groundwater flow direction, and estimate groundwater flow rates in the uppermost aquifer and in any zones of perched water and in any additional portions of the zone of saturation monitored. The results shall be reported semi-annually, including the times of expected highest and lowest elevations of the water levels in the wells, pursuant to Title 27, section 20415(e)(15).

² Inorganic parameters shall include: Ammonia, Phosphate, and Total Organic Carbon.

³ Trace Metals shall include: Barium, Cobalt, Lead, Mercury, Molybdenum, Selenium, Silver, and Vanadium.

⁴ Extraction wells shall be monitored as specified in Section A.8 for corrective action and are not part of the detection monitoring system.

2. Surface Water Monitoring

The Discharger has reported that no surface water from waste discharge areas regulated by these WDRs flows off-site. All surface water is returned to the treatment plant headworks. Therefore, these WDRs do not require surface water monitoring.

3. Unsaturated Zone Monitoring

The Discharger shall operate and maintain an unsaturated zone detection monitoring system that complies with the applicable provisions of Title 27, sections 20415 and 20420. The current unsaturated zone detection monitoring system meets the applicable requirements of Title 27. The Discharger shall install unsaturated zone monitoring devices (after review and approval by Central Valley Water Board staff) each time a new Class II waste management unit is constructed.

a. Solids Storage Basins

There is no unsaturated zone monitoring of the Solids Storage Basins (SSBs).

b. C-DLDs

The unsaturated zone for the unlined and closed DLDs (C-DLDs) including C-DLDs 1 and 5 shall be monitored by collecting soil core samples. Semiannually, four soil core samples are collected from randomly chosen locations within each C-DLD using a direct push drilling rig to a depth of fifteen feet below ground surface. Fifteen samples from the soil core, one sample from each foot, are analyzed for gravimetric water content and in-place density.

c. L-DLDs

The unsaturated zone monitoring network for the active, lined DLDs (L-DLDs) including L-DLDs 2, 3, and 4 include pan lysimeters located underneath the LCRS sumps. The current unsaturated zone monitoring network consists of:

<u>Monitoring Point</u>	<u>Status</u>	<u>Units Being Monitored</u>
L-DLD 2 SW	Detection	L-DLD 2
L-DLD 2 SE	Detection	L-DLD 2
L-DLD 3 SW	Detection	L-DLD 3
L-DLD 3 SE	Detection	L-DLD 3
L-DLD 4 NW	Detection	L-DLD 4
L-DLD 4 NE	Detection	L-DLD 4

Unsaturated zone samples shall be collected from the monitoring network listed above and shall be analyzed for the parameters and constituents listed in the following table in accordance with the specified methods and frequencies (pan lysimeters need only be sampled when liquid is present). Pan lysimeters shall be inspected for the presence of liquid **quarterly**. If liquid is detected in a previously dry pan lysimeter, the Discharger shall follow the procedures in the

WDRs under “C. Facility Specifications” and shall **immediately** sample and test the liquid for Field and Monitoring Parameters listed in the following table. If there is not enough liquid to analyze for all of the parameters, the analyses shall be conducted in the order of the indicated priorities 1, 2, and 3.

Table 2: L-DLD Liner Leak Detection Monitoring Program			
<u>Parameter</u>	<u>Units</u>	<u>Monitoring Frequency</u>	<u>Reporting Frequency</u>
<u>Field Parameters</u>			
Free Liquid	Presence/Absence	Quarterly	Semi-Annually
Volume Evacuated	Gallons	As Present	Semi-Annually
Specific Conductance (1)	µmhos/cm	As Present	Semi-Annually
pH (1)	Number	As Present	Semi-Annually
<u>Monitoring Parameters</u>			
Arsenic (3)	µg/L	As Required	Semi-Annually
Barium (3)	µg/L	As Required	Semi-Annually
Cadmium (3)	µg/L	As Required	Semi-Annually
Chromium (3)	µg/L	As Required	Semi-Annually
Cobalt (3)	µg/L	As Required	Semi-Annually
Copper (3)	µg/L	As Required	Semi-Annually
Lead (3)	µg/L	As Required	Semi-Annually
Mercury (3)	µg/L	As Required	Semi-Annually
Molybdenum (3)	µg/L	As Required	Semi-Annually
Nickel (3)	µg/L	As Required	Semi-Annually
Selenium (3)	µg/L	As Required	Semi-Annually
Silver (3)	µg/L	As Required	Semi-Annually
Vanadium (3)	µg/L	As Required	Semi-Annually
Zinc (3)	µg/L	As Required	Semi-Annually
Ammonia as Nitrogen (2)	mg/L	As Required	Semi-Annually
Chloride (2)	mg/L	As Required	Semi-Annually
Nitrate as Nitrogen (1)	mg/L	As Present	Semi-Annually
Phosphate (2)	mg/L	As Required	Semi-Annually
Sulfate (2)	mg/L	As Required	Semi-Annually
Total Kjeldahl Nitrogen (2)	mg/L	As Required	Semi-Annually
Total Organic Carbon (2)	mg/L	As Required	Semi-Annually
Total Dissolved Solids (2)	mg/L	As Required	Semi-Annually

The Discharger shall collect, preserve, and transport samples in accordance with the quality assurance/quality control standards contained in the approved Sample Collection and Analysis Plan.

Monitoring results for the unsaturated zone shall be included in monitoring reports and shall include an evaluation of potential impacts of the facility on the unsaturated zone and compliance with the Water Quality Protection Standard.

d. Closed Class III Landfill

There is no unsaturated zone monitoring for the Closed Class III Landfill (closed landfill).

4. LCRS Monitoring and Annual LCRS Testing

a. Solids Storage Basins

There is no LCRS monitoring for the SSBs.

b. C-DLDs

There is no LCRS monitoring for the C-DLDs.

c. L-DLDs

The Discharger shall operate and maintain leachate collection and removal system (LCRS) sumps, and conduct annual testing of each LCRS in accordance with Title 27 and this monitoring program.

The current LCRS leachate sump monitoring points are:

<u>Mon Pt.</u>	<u>Unit Where Sump is Located</u>
L-DLD 2	L-DLD 2
L-DLD 3	L-DLD 3
L-DLD 4	L-DLD 4

All LCRS sumps shall be inspected monthly for the presence of leachate, and flow shall be recorded in accordance with the following table.

Table 3: L-DLD Leachate (LCRS) Monitoring			
<u>Parameters</u>	<u>Units</u>	<u>Monitoring Frequency</u>	<u>Reporting Frequency</u>
<u>Field Parameters</u>			
Flow Volume	Gallons ¹	Monthly Total	Semi-Annually

Total Organic Carbon	mg/L	Annually	Annually
Total Dissolved Solids	mg/L	Annually	Annually

¹ Flow in gallons per day from LCRS sump back to wastewater treatment plant headworks

Annual LCRS Testing: All LCRSs shall be tested annually pursuant to Title 27, section 20340(d) to demonstrate proper operation. The results of these tests shall be reported to the Central Valley Water Board in the Annual Monitoring Report and shall include comparisons with earlier tests made under comparable conditions.

d. Closed Class III Landfill

There is no LCRS monitoring for the closed landfill.

5. Waste Discharge Monitoring

a. Solids Storage Basins

i. Digested Sludge

The Discharger shall monitor the volume and chemical constituents in the digested sludge discharged to the SSBs monthly with semi-annual reporting. Samples of digested sludge shall be collected from the digester discharge pipe in accordance with the following table:

Table 4: Solids Storage Basins Digested Sludge Monitoring			
<u>Parameter</u>	<u>Units</u>	<u>Monitoring Frequency</u>	<u>Reporting Frequency</u>
Quantity Discharged	Tons/day	Monthly	Semi-Annually
Total Solids	Percent	Monthly	Semi-Annually
Volatile Solids	Percent	Monthly	Semi-Annually
Specific Conductance	µmhos/cm	Monthly	Semi-Annually
pH	Number	Monthly	Semi-Annually
Chloride	mg/kg	Monthly	Semi-Annually
Sulfate	mg/kg	Monthly	Semi-Annually
Calcium	mg/kg	Monthly	Semi-Annually
Magnesium	mg/kg	Monthly	Semi-Annually
Potassium	mg/kg	Monthly	Semi-Annually
Sodium	mg/kg	Monthly	Semi-Annually
Total Phosphorus	mg/kg	Monthly	Semi-Annually
Total Nitrogen	mg/kg	Monthly	Semi-Annually
Nitrate as Nitrogen	mg/kg	Monthly	Semi-Annually
Nitrite as Nitrogen	mg/kg	Monthly	Semi-Annually
Total Kjeldahl Nitrogen	mg/kg	Monthly	Semi-Annually
Ammonia as Nitrogen	mg/kg	Monthly	Semi-Annually
Arsenic	mg/kg	Monthly	Semi-Annually
Cadmium	mg/kg	Monthly	Semi-Annually
Chromium	mg/kg	Monthly	Semi-Annually
Copper	mg/kg	Monthly	Semi-Annually
Lead	mg/kg	Monthly	Semi-Annually
Mercury	mg/kg	Monthly	Semi-Annually

Nickel	mg/kg	Monthly	Semi-Annually
Selenium	mg/kg	Monthly	Semi-Annually
Silver	mg/kg	Monthly	Semi-Annually
Zinc	mg/kg	Monthly	Semi-Annually

ii. Supernate

SSB supernate samples shall be collected from each SSB. Samples from the SSBs within each SSB battery shall be composited into one sample for laboratory analysis (one composite sample from each of the three batteries).

Samples of the SSB supernate shall be collected from the SSBs in accordance with the following table:

Table 5: Solids Storage Basins Supernate Monitoring			
<u>Parameter</u>	<u>Units</u>	<u>Monitoring Frequency</u>	<u>Reporting Frequency</u>
Total Suspended Solids	mg/L	Semi-Annually	Semi-Annually
Total Dissolved Solids	mg/L	Semi-Annually	Semi-Annually
Specific Conductance	µmhos/cm	Semi-Annually	Semi-Annually
Ammonia Nitrogen (NH ₄ -N)	mg/L	Semi-Annually	Semi-Annually
Nitrate as N	mg/L	Semi-Annually	Semi-Annually
Nitrite as N	mg/L	Semi-Annually	Semi-Annually
Chloride	mg/L	Semi-Annually	Semi-Annually
Sulfate	mg/L	Semi-Annually	Semi-Annually
Sodium	mg/L	Semi-Annually	Semi-Annually
Calcium	mg/L	Semi-Annually	Semi-Annually

b. C-DLDs

There is no waste discharge monitoring of the C-DLDs.

c. L-DLDs

i. Harvested Sludge

The Discharger shall monitor the stabilized sludge (biosolids) discharged to the L-DLDs for the parameters listed below in Table 6. The monitoring shall occur at least two times per SSB harvested during the sludge removal season.

Table 6: L-DLD Waste Discharge Monitoring			
<u>Parameter</u>	<u>Units</u>	<u>Monitoring Frequency</u>	<u>Reporting Frequency</u>
Biosolids Source	Slurry or Dewatered	During SSB harvest*	Annually
Application Rate to L-DLD	Dry tons/acre	During SSB harvest*	Annually
Total Solids	Percent	During SSB harvest*	Annually
Volatile Solids	Percent	During SSB harvest*	Annually
Specific Conductance	µmhos/cm	During SSB harvest*	Annually
pH	Number	During SSB harvest*	Annually
Chloride	mg/kg	During SSB harvest*	Annually

Mercury	mg/kg	During SSB harvest*	Annually
Molybdenum	mg/kg	During SSB harvest*	Annually
Nickel	mg/kg	During SSB harvest*	Annually
Selenium	mg/kg	During SSB harvest*	Annually
Silver	mg/kg	During SSB harvest*	Annually
Zinc	mg/kg	During SSB harvest*	Annually

*Monitoring shall occur at least two times per SSB harvested during the sludge removal season

ii. **Soil Monitoring**

Semiannually the Discharger shall monitor soil pH at two surface locations for each L-DLD. The Discharger shall report the amount of lime applied to the L-DLDs in order to maintain the soil pH above the minimum level required by the WDRs.

The L-DLD monitoring shall include annual monitoring of the soil beneath the L-DLDs for the parameters listed in Table 7. The Discharger shall collect and analyze samples from two locations at each L-DLD. The Discharger shall sample each location at the following depths below the surface: 6-inches, 18-

inches and 36-inches. The Discharger shall collect the samples prior to the end of the annual application of stabilized sludge (biosolids) to the L-DLDs.

Table 7: L-DLD Soil Monitoring Program			
<u>Parameter</u>	<u>Units</u>	<u>Monitoring Frequency</u>	<u>Reporting Frequency</u>
Moisture Content	Percent	Annually	Annually
Cation Exchange Capacity	meq/100 mg	Annually	Annually

Mercury	mg/kg	Annually	Annually
Nickel	mg/kg	Annually	Annually
Selenium	mg/kg	Annually	Annually
Silver	mg/kg	Annually	Annually
Zinc	mg/kg	Annually	Annually

d. Closed Class III Landfill

There is no waste discharge monitoring of the closed landfill.

6. Closed Class III Landfill Gas Monitoring

The Discharger shall collect, analyze, and report data for landfill gas monitoring as required by CalRecycle. Current monitoring for landfill gas occurs at monitoring locations GW-6, GW-9, and GW-10. Copies of the CalRecycle landfill gas monitoring reports shall be included with the annual monitoring reports.

7. Facility Monitoring

a. Annual Facility Inspection

Annually, prior to the anticipated rainy season, but no later than **30 September**, the Discharger shall conduct an inspection of the facility. The inspection shall assess repair and maintenance needed for liner systems; LCRS pumps, piping and control systems; drainage control systems; groundwater monitoring wells; unsaturated zone monitoring systems; and shall assess preparedness for winter conditions including but not limited to the required surface impoundment capacity and erosion and sedimentation control. The Discharger shall take photos of any problems areas before and after repairs.

Any necessary construction, maintenance, or repairs shall be completed by **31 October**. Annual facility inspection reporting shall be submitted as required in Section B.3 of this MRP.

b. Major Storm Events

The Discharger shall inspect all precipitation, diversion, and drainage facilities and all waste management unit berms for damage **within 7 days** following major storm events capable of causing damage or significant erosion. SSB and DLD runoff zone freeboard shall be measured and recorded within 24 hours after onsite rainfall of greater than two inches in a 24 hour period. The Discharger shall take photos of any problems areas before and after repairs. Necessary repairs shall be completed **within 30 days** of the inspection. Notification and reporting requirements for major storm events shall be conducted as required in Section B.4 of this MRP.

c. Dedicated Land Disposal Units Inspections

The Discharger shall visually inspect the DLDs surfaces semi-annually and following unusual events such as major storms, earthquakes, and fires. Surface cracking, ponding, surface drainage interruptions, or unusual surface conditions should be identified during the inspections. Vegetation cover and plant health on closed DLDs should also be observed and notated during inspections. Results of the Inspections shall be submitted in the semiannual monitoring reports required in Section B.1 of this MRP.

d. Closed Class III Landfill Standard Observations

The Discharger shall conduct Standard observations at the closed landfill in accordance with this section of the MRP. Standard observations shall be conducted in accordance with the following schedule:

<u>Landfill Unit Type</u>	<u>Frequency</u>	<u>Season</u>
Inactive/Closed	Monthly	Wet: 15 October to 15 May
Inactive/Closed	Quarterly	Dry: 16 May to 14 October

The Standard Observations shall include:

1. For the closed landfill units:
 - a. Evidence of ponded water at any point on the closed landfill outside of any contact storm water diversions structures on the active face (show affected area on map); and
 - b. Evidence of erosion and/or of day-lighted refuse.
2. Along the perimeter of the closed landfill units:

- a. Evidence of leachate seeps, estimated size of affected area, and flow rate (show affected area on map); and

3. Evidence of erosion and/or of day-lighted refuse.

Results of Standard Observations shall be submitted in the semiannual monitoring reports required in Section B.1 of this MRP.

8. Corrective Action Monitoring

The Discharger shall conduct corrective action monitoring to demonstrate the effectiveness of corrective action in accordance with Title 27, section 20430 and this MRP. Groundwater monitoring wells that are in a corrective action monitoring program shall be monitored quarterly for groundwater elevation.

The existing corrective action monitoring wells are listed below. The Discharger shall monitor and report semiannually: the average and accumulated flow of groundwater extracted, the effectiveness of cleanup, and the hydraulic influence of the well extraction network.

<u>Extraction Well</u>	<u>Zone</u>	<u>WMU Being Addressed</u>
MW-228R	Shallow Zone	C-DLDs 1 and 5, L-DLD 3
MW-233	Shallow Zone	C-DLDs 1 and 5, L-DLD 3
MW-235	Shallow Zone	C-DLDs 1 and 5, L-DLD 3
MW-236	Shallow Zone	C-DLDs 1 and 5, L-DLD 3
MW-303	First Aquifer	C-DLDs 1 and 5, L-DLD 3
MW-306	First Aquifer	C-DLDs 1 and 5, L-DLD 3
MW-307	First Aquifer	C-DLDs 1 and 5, L-DLD 3
MW-308	First Aquifer	C-DLDs 1 and 5, L-DLD 3
MW-313	First Aquifer	C-DLDs 1 and 5, L-DLD 3
MW-315	First Aquifer	C-DLDs 1 and 5, L-DLD 3
MW-328	First Aquifer	C-DLDs 1 and 5, L-DLD 3
MW-329	First Aquifer	C-DLDs 1 and 5, L-DLD 3
MW-330	First Aquifer	C-DLDs 1 and 5, L-DLD 3
MW-331	First Aquifer	C-DLDs 1 and 5, L-DLD 3
MW-332	First Aquifer	C-DLDs 1 and 5, L-DLD 3
MW-333	First Aquifer	C-DLDs 1 and 5, L-DLD 3
MW-334	First Aquifer	C-DLDs 1 and 5, L-DLD 3

B. REPORTING

The Discharger shall submit the following reports in accordance with the required schedule:

Reporting Schedule

<u>Section</u>	<u>Report</u>	<u>End of Reporting Period</u>	<u>Due Date</u>
B.1	Semiannual Monitoring Report	30 June, 31 December	1 August, 1 February
B.2	Annual Monitoring Report	31 December	1 February
B.3	Annual Facility Inspection Report	31 October	15 November
B.4	Major Storm Event Reporting	Continuous	7 days from damage discovery
B.5	Financial Assurances Report	31 December	1 June

Reporting Requirements

The Discharger shall submit monitoring reports **semiannually** with the data and information as required in this Monitoring and Reporting Program and as required in WDRs Order R5-2015-0133 and the Standard Provisions and Reporting Requirements (particularly Section I: "Standard Monitoring Specifications" and Section J: "Response to a Release"). In reporting the monitoring data required by this program, the Discharger shall arrange the data in tabular form so that the date, the constituents, the concentrations, and the units are readily discernible. The data shall be summarized in such a manner so as to illustrate clearly the compliance with waste discharge requirements or the lack thereof. Data shall also be submitted in a digital format, such as a computer disk.

Field and laboratory tests shall be reported in each monitoring report. Semiannual and annual monitoring reports shall be submitted to the Central Valley Water Board in accordance with the above schedule for the calendar period in which samples were taken or observations made. In addition, the Discharger shall enter all monitoring data and monitoring reports into the online Geotracker database as required by Division 3 of Title 27.

The results of **all monitoring** conducted at the site shall be reported to the Central Valley Water Board in accordance with the reporting schedule above for the calendar period in which samples were taken or observations made.

The Discharger shall retain records of all monitoring information, including all calibration and maintenance records, all original strip chart recordings of continuous monitoring instrumentation, copies of all reports required by this Order, and records of all data used to complete the application for this Order. Records shall be maintained

throughout the life of the facility. Such records shall be legible and shall show the following for each sample:

- a) Sample identification and the monitoring point or background monitoring point from which it was taken, along with the identity of the individual who obtained the sample;
- b) Date, time, and manner of sampling;
- c) Date and time that analyses were started, and the name of the personnel and laboratory performing each analysis;
- d) Complete procedure used, including method of preserving the sample, and the identity and volumes of reagents used;
- e) Calculation of results; and
- f) Results of analyses, and the MDL and PQL for each analysis. All peaks shall be reported.

Required Reports

1. **Semiannual Monitoring Report:** Monitoring reports shall be submitted semiannually and are due on **1 August** and **1 February**. Each semiannual monitoring report shall contain at least the following:
 - a) For each groundwater monitoring point addressed by the report, a description of:
 - 1) The time of water level measurement;
 - 2) The type of pump - or other device - used for purging and the elevation of the pump intake relative to the elevation of the screened interval;
 - 3) The method of purging used to stabilize water in the well bore before the sample is taken including the pumping rate; the equipment and methods used to monitor field pH, temperature, and conductivity during purging; results of pH, temperature, conductivity, and turbidity testing; and the method of disposing of the purge water;
 - 4) The type of pump - or other device - used for sampling, if different than the pump or device used for purging; and
 - 5) A statement that the sampling procedure was conducted in accordance with the approved Sample Collection and Analysis Plan.
 - b) A map or aerial photograph showing the locations of observation stations, monitoring points, and background monitoring points.

- c) The estimated quarterly groundwater flow rate and direction in the uppermost aquifer, in any zones of perched water, and in any additional zone of saturation monitored based upon water level elevations taken prior to the collection of the water quality data submitted in the report [Title 27, section 20415(e)(15)].
 - d) Cumulative tabulated monitoring data for all monitoring points and constituents for groundwater, LCRS/leachate, unsaturated zone, SSBs, C-DLDs, and L-DLDs. Concentrations below the laboratory reporting limit shall not be reported as "ND" unless the reporting limit is also given in the table. Otherwise they shall be reported "<" the reporting limit (e.g., <0.10). Units shall be as required in Tables 1 through 5 unless specific justification is given to report in other units. Refer to the SPRRs Section I "Standard Monitoring Specifications" for requirements regarding MDLs and PQLs.
 - e) Laboratory statements of results of all analyses evaluating compliance with requirements.
 - f) An evaluation of the concentration of each monitoring parameter as compared to the current concentration limits, and the results of any required verification testing for constituents exceeding a concentration limit. Report any actions taken under Section J: Response to a Release in the SPRRs for verified exceedances of a concentration limit for wells/constituents not already in corrective action monitoring.
 - g) A summary of visual inspection of the DLD surface semi-annually and following events such as major storms, earthquakes, and fire.
 - h) A summary of all waste discharge monitoring required in Section A.5 of this MRP.
 - i) A summary of all Facility Monitoring including onsite rainfall data for the reporting period required in Section A.7 of this MRP.
 - j) A summary of all Corrective Action Program monitoring required in Section A.8 of this MRP.
 - k) A discussion about any solids that were removed from the SSBs during the reporting period to regain capacity.
 - l) Results from additional monitoring requirements specified in the Revised Final Post-Closure Monitoring Plan required by WDR R5-2015-0133.
2. **Annual Monitoring Report:** The Discharger shall submit an Annual Monitoring Report to the Central Valley Water Board by **1 February** covering the reporting period of the previous monitoring year. If desired, the Annual Monitoring Report may be combined with the second semiannual report, but if so, shall clearly state that it is both a semi-annual and annual monitoring report in its title. Each Annual Monitoring Report shall contain the following additional information beyond what is required for semiannual monitoring reports:

- a) All monitoring parameters shall be graphed to show historical trends at each monitoring point and background monitoring point, for all samples taken within at least the previous five calendar years. Each such graph shall plot the concentration of one or more constituents for the period of record for a given monitoring point or background monitoring point, at a scale appropriate to show trends or variations in water quality. The graphs shall plot each datum, rather than plotting mean values. Graphical analysis of monitoring data may be used to provide significant evidence of a release.
- b) An evaluation of the monitoring parameters with regards to the cation/anion balance, and a graphical presentation using a Stiff diagram, a Piper graph, or a Schoeller plot.
- c) All historical monitoring data for which there are detectable results, including data for the previous year, shall be submitted in tabular form in a digital file format such as a computer disk. The Central Valley Water Board regards the submittal of data in hard copy and in digital format as "...the form necessary for..." statistical analysis [Title 27, section 20420(h)], that facilitates periodic review by the Central Valley Water Board.
- d) Hydrographs of each well showing the elevation of groundwater with respect to the elevations of the top and bottom of the screened interval and the elevation of the pump intake. Hydrographs of each well shall be prepared quarterly and submitted annually.
- e) A comprehensive discussion of the compliance record, and the result of any corrective actions taken or planned which may be needed to bring the Discharger into full compliance with the waste discharge requirements.
- f) A written summary of the monitoring results, indicating any changes made or observed since the previous Annual Monitoring Report.
- g) The results of the annual testing of the LCRS.
- h) Updated concentration limits for each monitoring parameter at each monitoring well based on the new background data set.
- i) A comprehensive discussion of any Corrective Action Program required by this MRP under Section A.8 including a discussion of long-term trends in the concentrations of the pollutants in the groundwater monitoring wells and an analysis of whether the pollutants are being effectively treated.
- j) Copies of the CalRecycle landfill gas monitoring reports.
- k) Trend analysis results for L-DLD leachate soluble metals versus pH as detailed in WDR R5-2015-0133 Finding 73.
- l) Adequacy of the C-DLD vegetation and if mitigation measures are required as detailed in WDR R5-2015-0133 Finding 92 and Provision E.21.

3. **Annual Facility Inspection Reporting:** By **15 November** of each year, the Discharger shall submit a report describing the results of the inspection and the repair measures implemented, preparations for winter, and include photographs of any problem areas and the repairs. Refer to Section A.7.a of this MRP, above.
4. **Major Storm Event Reporting:** The Discharger shall notify Central Valley Water Board staff within 24 hours after a storm event of greater than two inches in 24 hours as to the status of freeboard in the SSBs and DLD storm water runoff zones. The Discharger shall also notify Central Valley Water Board staff within **7 days** after major storm events of any damage or significant erosion and report any needed repairs within **14 days** of completion of the repairs, including photographs of the problem and the repairs. Refer to Section A.7.b of this MRP above for requirements for performing the inspection and conducting the repairs.
5. **Financial Assurances Report:** By **1 June** of each year, the Discharger shall submit a report to the Central Valley Water Board that reports the balance of both the closure and corrective action funds or the amounts of the Guarantees and the adjustments to account for inflation in accordance with Title 27 Section 22236. Refer to Financial Assurances Specifications F.1 through F.3 of the WDRs.

C. WATER QUALITY PROTECTION STANDARD AND COMPLIANCE PERIOD

1. Water Quality Protection Standard Report

For each waste management unit, the Water Quality Protection Standard shall consist of all COCs, the concentration limit for each constituent of concern, the verification retesting procedure to confirm measurably significant evidence of a release, the point of compliance, and all water quality monitoring points for each monitored medium.

The Water Quality Protection Standard for naturally occurring waste constituents consists of the COCs, the concentration limits, and the point of compliance and all monitoring points. Any proposed changes to the Water Quality Protection Standard other than annual update of the concentration limits shall be submitted in a report for review and approval.

The report shall:

- a. Identify **all distinct bodies of surface and ground water** that could be affected in the event of a release from a waste management unit or portion of a unit. This list shall include at least the uppermost aquifer and any permanent or ephemeral zones of perched groundwater underlying the facility.
- b. Include a map showing the monitoring points and background monitoring points for the surface water monitoring program, groundwater monitoring program,

and the unsaturated zone monitoring program. The map shall include the point of compliance in accordance with Title 27, section 20405.

- c. Evaluate the perennial direction(s) of groundwater movement within the uppermost groundwater zone(s).
- d. Include a proposed statistical method for calculating concentration limits for monitoring parameters and constituents of concern that are detected in 10% or greater of the background data (naturally-occurring constituents) using a statistical procedure from Title 27, section 20415(e)(8)(A-D)] or section 20415(e)(8)(E).
- e. Include a retesting procedure to confirm or deny measurably significant evidence of a release pursuant to Title 27, section 20415(e)(8)(E) and section 20420(j)(1-3).

The Water Quality Protection Standard shall be certified by a California-professional civil engineer or professional geologist as meeting the requirements of Title 27. If subsequent sampling of the background monitoring point(s) indicates significant water quality changes due to either seasonal fluctuations or other reasons unrelated to waste management activities at the site, the Discharger may request modification of the Water Quality Protection Standard. The WQPS shall be reviewed and updated, as necessary, at least every 5 years. An updated WQPS report shall be submitted in accordance with MRP Section I.4.b.

2. Monitoring Parameters

Monitoring parameters are a select group of constituents that are monitored during each monitoring event that are the waste constituents, reaction products, hazardous constituents, and physical parameters that provide a reliable indication of a release from a waste management unit. The monitoring parameters for all waste management units are those listed in the tables in Section A of this MRP specified monitored medium.

3. Concentration Limits

For a naturally occurring constituent of concern, the concentration limit for each constituent of concern shall be determined as follows:

- a. By calculation in accordance with a statistical method pursuant to Title 27, section 20415(e)(8); or
- b. By an alternate statistical method meeting the requirements of Title 27, section 20415(e)(8)(E).

5. Retesting Procedures for Confirming Evidence of a Release

If monitoring results indicate measurably significant evidence of a release, as described in Standard Monitoring Specification I.43 of the SPRRs, then:

- a. For analytes that are detected in less than 10% of the background samples (such as non-naturally occurring constituents), the Discharger shall use the non-statistical retesting procedure required in Standard Monitoring Specification I.44 of the SPRRs.
- b. For analytes that are detected in 10% or greater of the background samples (naturally occurring constituents), the Discharger shall use one of the statistical retesting procedure as required in Standard Monitoring Specification I.45 of the SPRRs.

6. Point of Compliance

The point of compliance for the water standard at each waste management unit is a vertical surface located at the hydraulically downgradient limit of the Unit that extends through the uppermost aquifer underlying the unit. The following are monitoring locations at the point of compliance:

<u>Cell or Module</u>	<u>Point of Compliance Monitoring Wells</u>
Closed Landfill	MW-228R, MW-324
C-DLD 1	MW-232, MW-305
L-DLD 2	MW-239
L-DLD 3	MW-233, MW-303, MW-315, MW-322, MW-323, MW-329, MW-330, MW-331, MW-336, MW-337, MW-341
L-DLD 4	MW-233, MW-303, MW-315, MW-322, MW-323, MW-329, MW-330, MW-331, MW-336, MW-337, MW-341
C-DLD 5	MW-235, MW-307, MW-317, MW-338
SSB Battery I	MW-223, MW-238
SSB Battery II	MW-240, MW-241
SSB Battery III	MW-242, MW-243, MW-225

7. Compliance Period

The compliance period for each waste management unit shall be the number of years equal to the active life of the unit plus the closure period. The compliance

period is the minimum period during which the Discharger shall conduct a water quality monitoring program subsequent to a release from the waste management unit. The compliance period shall begin anew each time the Discharger initiates an evaluation monitoring program [Title 27, section 20410].

8. Monitoring Points

A monitoring point is a well, device, or location specified in the waste discharge requirements, which monitoring is conducted and at which the water quality protection standard applies. The monitoring points for each monitored medium are listed in Section A of this MRP.

D. TRANSMITTAL LETTER FOR ALL REPORTS

A transmittal letter explaining the essential points shall accompany each report. At a minimum, the transmittal letter shall identify any violations found since the last report was submitted, and if the violations were corrected. If no violations have occurred since the last submittal, this shall be stated in the transmittal letter. The transmittal letter shall also state that a discussion of any violations found since the last report was submitted, and a description of the actions taken or planned for correcting those violations, including any references to previously submitted time schedules, is contained in the accompanying report. The transmittal letter shall contain a statement by the Discharger, or the Discharger's authorized agent, under penalty of perjury, that to the best of the signer's knowledge the report is true, accurate, and complete.

The Discharger shall implement the above monitoring program on the effective date of this Program.

SACRAMENTO REGIONAL COUNTY SANITATION DISTRICT; SACRAMENTO REGIONAL WASTEWATER TREATMENT PLANT; SACRAMENTO COUNTY

The Sacramento Regional County Sanitation District (Discharger) owns and operates treatment, storage and disposal facilities for digested sludge (or 'biosolids') and solids generated from the Sacramento Regional Wastewater Treatment Plant (facility) about eight miles south of Sacramento and one mile east of the town of Freeport. The wastewater treatment plant process area and waste management facilities occupy about 900 acres of the 3,550 acre site. The facilities regulated by WDRs include twenty unclassified Solids Storage Basins (SSBs), five Class II land treatment units (LTUs) referred to as Dedicated Land Disposal Units (DLDs) [three active, lined DLDs (L-DLDs) and two closed, unlined (C-DLDs)], and a closed Class III grit and screenings landfill (closed landfill). The facility was previously regulated by Waste Discharge Requirements (WDRs) Orders 98-087, 5-01-263, and R5-2003-0076 in conformance with Title 27, California Code of Regulations (27 CCR), Division 2, Subdivision 1 (hereafter Title 27).

The SSBs function as sewage sludge treatment and storage units and meet the requirements for exemption from Title 27 provisions, pursuant to Title 27 §20090 (a); however, the SSBs are subject to the State Water Resources Control Board Resolution 68-16 ("Policy with Respect to Maintaining High Quality Waters of the State") (hereafter Resolution 68-16) which prohibits degradation of high quality groundwater.

Information submitted by the Discharger was used to revise WDRs R5-2003-0076 to include provisions to:

- a. Require evaluation of potential groundwater impacts from the SSBs
- b. Utilize C-DLD 1 for soil stockpiles and haul roads during plant construction work beginning in 2015
- c. Require Final Action Levels for the C-DLD 1 and 5 final cover systems
- d. Convert previously closed C-DLDs 1 and 5 to L-DLDs
- e. Clean-close the closed landfill
- f. Redirect return flow from the Biosolids Recycling Facility (BRF) to the SSBs
- g. Update the Water Quality Protection Standards and Sampling and Analysis Plan

A. APPLICABILITY

1. These Standard Provisions and Reporting Requirements (SPRRs) are applicable to Class II surface impoundments, waste piles, and land treatment units that are regulated by the Central Valley Regional Water Quality Control Board (hereafter, Central Valley Water Board) pursuant to the provisions of California Code of Regulations, title 27 ("Title 27"), section 20005 et seq.
2. "Order," as used throughout this document, means the Waste Discharge Requirements (WDRs) to which these SPRRs are incorporated.
3. The requirements prescribed herein do not authorize the commission of any act causing injury to the property of another, and do not protect the Discharger from liabilities under federal, state, or local laws. This Order does not convey any property rights or exclusive privileges.
4. The provisions of this Order are severable. If any provision of this Order is held invalid, the remainder of this Order shall not be affected.
5. If there is any conflicting or contradictory language between the WDRs, the Monitoring and Reporting Program (MRP), or the SPRRs, then language in the WDRs shall govern over either the MRP or the SPRRs, and language in the MRP shall govern over the SPRRs.
6. If there is a site-specific need to change a requirement in these SPRRs for a particular facility, the altered requirement shall be placed in the appropriate section of the WDRs and will supersede the corresponding SPRRs requirement. These SPRRs are standard and cannot be changed as part of the permit writing process or in response to comments, but they will be periodically updated on an as-needed basis.
7. Unless otherwise stated, all terms are as defined in Water Code section 13050 and in Title 27, section 20164.

B. TERMS AND CONDITIONS

1. Failure to comply with any waste discharge requirement, monitoring and reporting requirement, or Standard Provisions and Reporting Requirement, or other order or prohibition issued, reissued, or amended by the Central Valley Water Board or the State Water Board, or intentionally or negligently discharging waste, or causing or permitting waste to be deposited where it is discharged into the waters of the state and creates a condition of pollution or nuisance, is a violation of this Order and the Water Code, which can result in the imposition of civil monetary liability [Wat. Code, § 13350(a)]
2. After notice and opportunity for a hearing, this Order may be terminated or modified for cause, including, but not limited to [Wat. Code, § 13381]:

- a. Violation of any term or condition contained in this Order;
 - b. Obtaining this Order by misrepresentation, or failure to disclose fully all relevant facts;
 - c. A change in any condition that results in either a temporary or permanent need to reduce or eliminate the authorized discharge; or
 - d. A material change in the character, location, or volume of discharge.
3. Before initiating a new discharge or making a material change in the character, location, or volume of an existing discharge, the Discharger shall file a new report of waste discharge (ROWD), or other appropriate joint technical document (JTD), with the Central Valley Water Board [Wat. Code, § 13260(c) and § 13264(a)]. A material change includes, but is not limited to, the following:
 - a. An increase in area or depth to be used for solid waste disposal beyond that specified in waste discharge requirements;
 - b. A significant change in disposal method, location, or volume (e.g., change from land disposal to land treatment);
 - c. A change in the type of waste being accepted for disposal; or
 - d. A change to previously-approved liner systems or final cover systems that would eliminate components or reduce the engineering properties of components.
4. Representatives of the Central Valley Water Board may inspect the facilities to ascertain compliance with the waste discharge requirements. The inspection shall be made with the consent of the owner or possessor of the facilities or, if the consent is refused, with a duly issued warrant. However, in the event of an emergency affecting the public health or safety, an inspection may be made without consent or the issuance of a warrant [Wat. Code, §13267(c)].
5. The Central Valley Water Board will review this Order periodically and will revise these waste discharge requirements when necessary [Wat. Code, § 13263(e) and Title 27, § 21720(b)].
6. Except for material determined to be confidential in accordance with California law and regulations, all reports prepared in accordance with terms of this Order shall be available for public inspection at the offices of the Central Valley Water Board [Wat. Code, § 13267(b)]. Data on waste discharges, water quality, geology, and hydrogeology shall not be considered confidential.
7. A discharge of waste into the waters of the state is a privilege, not a right. No discharge of waste into waters of the state, whether or not the discharge is

made pursuant to waste discharge requirements, shall create a vested right to continue the discharge [Wat. Code, § 13263(g)].

8. Technical and monitoring reports specified in this Order are requested pursuant to the Water Code [§13267(b)]. Failure to furnish the reports by the specified deadlines or falsifying information in the reports, are misdemeanors that may be liable civilly in accordance with §13268(b) of the Water Code [Wat. Code, §13268(a)].

C. STANDARD PROHIBITIONS

1. The discharge of wastes which have the potential to reduce or impair the integrity of containment structures or which, if commingled with other wastes in the waste management unit, could produce violent reaction, heat or pressure, fire or explosion, toxic by-products, or reaction products, which, in turn:
 - a. require a higher level of containment than provided by the unit; or
 - b. are 'restricted wastes'; or
 - c. impair the integrity of containment structures;is prohibited [Title 27, § 20200(b)].
2. The discharge of wastes outside of a waste management unit or portions of a unit specifically designed for their containment is prohibited.
3. The discharge of waste to a closed waste management unit is prohibited.
4. The discharge of waste constituents to the unsaturated zone or to groundwater is prohibited, except within the treatment zone at a land treatment unit.
5. The discharge of solid or liquid waste or leachate to surface waters, surface water drainage courses, or groundwater is prohibited.

D. STANDARD DISCHARGE SPECIFICATIONS

1. The Discharger is responsible for accurate characterization of wastes, including a determination of whether or not wastes will be compatible with containment features and other wastes at the waste management unit and whether or not the wastes are required to be managed as a hazardous waste [Title 27, § 20200(c)] or designated waste [Title 27, § 20210].
2. Leachate collected from a waste management unit shall be discharged to the unit from which it came, or discharged to an appropriate waste management unit in accordance with Title 27 and in a manner consistent with the waste classification of the liquid [Title 27, § 20200(d) and § 20340(g)].

3. Wastes shall be discharged only into waste management units specifically designed for their containment and/or treatment, as described in this Order.
4. The discharge shall remain within the designated disposal area at all times.
5. The discharge of waste shall not cause a nuisance condition [Wat. Code, § 13050(m)].

E. STANDARD FACILITY SPECIFICATIONS

1. All waste management units shall be designed, constructed, and operated to ensure that wastes, including leachate, will be a minimum of 5 feet above the highest anticipated elevation of underlying groundwater [Title 27, § 20240(c)], including the capillary fringe.
2. Surface and subsurface drainage from outside of a waste management unit shall be diverted from the unit [Title 27, § 20365(e)].
3. The Discharger shall **immediately** notify the Central Valley Water Board staff of any slope failure occurring at a waste management unit. Any failure which threatens the integrity of containment features or the waste management unit shall be promptly corrected in accordance with an approved method [Title 27, § 21710(c)(2)].
4. The Discharger shall **immediately** notify Central Valley Water Board staff of any flooding, unpermitted discharge of waste off-site or outside of waste management units, equipment failure, or other change in site conditions which could impair the integrity of waste or leachate containment facilities or precipitation and drainage control structures.
5. The Discharger shall maintain in good working order any facility, control system, or monitoring device installed to achieve compliance with the waste discharge requirements.
6. The Discharger shall lock all groundwater monitoring wells with a lock on the well cap or monitoring well box. All monitoring devices shall be clearly labeled with their designation including all monitoring wells, LCRS risers, and lysimeter risers and shall be easily accessible for required monitoring by authorized personnel. Each monitoring device shall be clearly visible and be protected from damage by equipment or vehicles.
7. The Discharger shall maintain the depth of the fluid in the sump of each waste management unit at the minimum needed for efficient pump operation (the depth at which the pump turns on given the pump intake height and maximum pump cycle frequency).

8. Each LCRS shall be tested at least annually to demonstrate proper operation. The results of the tests shall be compared with earlier tests made under comparable conditions [Title 27, § 20340(d)].
9. The Discharger shall maintain a *Storm Water Pollution Prevention Plan and Monitoring Program and Reporting Requirements* in accordance with State Water Board Order No. 97-03-DWQ (or most recent general industrial storm water permit), or retain all storm water on-site.

F. STANDARD CONSTRUCTION SPECIFICATIONS

1. The Discharger shall submit for review and approval at least **90 days** prior to proposed construction, design plans and specifications for new Class II waste management units that include the following:
 - a. Detailed construction drawings showing all required liner system components, the LCRS, leachate sump, unsaturated zone monitoring system, and access to the LCRS for required annual testing.
 - b. A Construction Quality Assurance (CQA) Plan prepared by a California-registered civil engineer or certified engineering geologist, and that meets the requirements of Title 27, section 20324.
 - c. A geotechnical evaluation of the area soils, evaluating their use as the base layer or reference to the location of this information in the ROWD/JTD [Title 27, § 21750(f)(4)].
 - d. Information about the seismic design of the proposed new waste management unit (or reference to the location of this information in the ROWD/JTD) in accordance with Title 27, section 20370.
 - e. A revised water quality monitoring plan for groundwater detection monitoring (or information showing the existing plan is adequate) in accordance with Title 27, section 20415.
 - f. An Operation Plan (or reference to the location of this information in the ROWD/JTD) meeting the requirements of Title 27, sections 21760(b) and 20375(b).
2. All containment structures shall be designed by, and construction shall be supervised by, a California registered civil engineer or a certified engineering geologist, and shall be certified by that individual as meeting the prescriptive standards, or approved engineered alternative design, in accordance with this Order prior to waste discharge.
3. The Discharger shall not proceed with construction until the construction plans, specifications, and all applicable construction quality assurance plans have

been approved. Waste management units shall receive a final inspection and approval of the construction by Central Valley Water Board staff before use of the unit commences [Title 27, § 20310(e)].

4. Any report, or any amendment or revision of a report, that proposes a design or design change that might affect a waste management unit's containment features or monitoring systems shall be approved by a California registered civil engineer or a certified engineering geologist [Title 27, § 21710(d)].
5. Materials used in containment structures shall have appropriate chemical and physical properties to ensure that such structures do not fail to contain waste because of pressure gradients, physical contact with waste or leachate, chemical reactions with soil or rock, climatic conditions, the stress of installation, or because of the stress of daily operations [Title 27, § 20320(a)].
6. Waste management units and their respective containment structures shall be designed and constructed to limit, to the greatest extent possible, ponding, infiltration, inundation, erosion, slope failure, washout, and overtopping [Title 27, § 20365(a)].
7. The Discharger shall design storm water conveyance systems for Class II units for a 1,000-year, 24-hour storm event [Title 27, § 21750(e)(3)].
8. All Class II waste management units shall be designed to withstand maximum credible earthquake without damage to the foundation or to the structures that control leachate, or surface drainage, or erosion [Title 27, § 20370(a)].
9. The Discharger shall perform stability analyses that include components to demonstrate the integrity of the waste management unit foundation, final slopes, and containment systems under both static and dynamic conditions throughout the life of the unit [Title 27, § 21750(f)(5)].
10. New Class II Units, other than LTUs and expansions of existing Class II units, shall have a 200 foot setback from any known Holocene fault. [Title 27, § 20250(d)].
11. Liners shall be designed and constructed to contain the fluid, including waste, and leachate [Title 27, § 20330(a)].
12. Hydraulic conductivities shall be determined primarily by appropriate field test methods in accordance with accepted civil engineering practice. The results of laboratory tests with both water and leachate, and field tests with water, shall be compared to evaluate how the field permeabilities will be affected by leachate. It is acceptable for the Discharger to use appropriate compaction tests in conjunction with laboratory hydraulic conductivity tests to determine field permeabilities as long as a reasonable number of field hydraulic conductivity tests are also conducted [Title 27, § 20320(c)].

13. Hydraulic conductivities specified for containment structures other than the final cover shall be relative to the fluids (leachate) to be contained. Hydraulic conductivities for the final cover shall be relative to water [Title 27, § 20320(b)].
14. A test pad for each barrier layer and any final cover shall be constructed in a manner duplicating the field construction. Test pad construction methods, with the designated equipment, shall be used to determine if the specified density/moisture-content/hydraulic conductivity relationships determined in the laboratory can be achieved in the field with the compaction equipment to be used and at the specified lift thickness [Title 27, § 20324(g)(1)(A)].
15. The Discharger shall ensure proper preparation of the subgrade for any liner system that includes a GCL so as to provide a smooth surface that is free from rocks, sticks, or other debris that could damage or otherwise limit the performance of the GCL.
16. The Discharger shall propose an electronic leak location survey of the top liner for any new waste management unit in the construction quality assurance plan unless the Discharger demonstrates that a leak location survey is not needed.
17. Leachate collection and removal systems are required for Class II surface impoundments [Title 27, § 20340(a)].
18. The LCRS shall be designed, constructed, maintained, and operated to collect and remove twice the maximum anticipated daily volume of leachate from the waste management unit [Title 27, § 20340(b)].
19. Leachate collection and removal systems shall be designed and operated to function without clogging through the life of the waste management unit.
20. The leachate sump, leachate removal pump, and pump controls shall be designed and set to maintain a fluid depth no greater than the minimum needed for efficient pump operation [Title 27, § 20340(c)].
21. All construction of liner systems and final cover systems shall be performed in accordance with a Construction Quality Assurance Plan certified by a registered civil engineer or a certified engineering geologist [Title 27, § 20323].
22. The Construction Quality Assurance program shall be supervised by a registered civil engineer or a certified engineering geologist who shall be designated the CQA officer [Title 27, § 20324(b)(2)].
23. The Discharger shall ensure that a third party independent of both the Discharger and the construction contractor performs all of the construction quality assurance monitoring and testing during the construction of a liner system.

24. The Discharger shall notify Central Valley Water Board staff at least **14 days** prior to commencing field construction activities including construction of a new Class II waste management unit, construction of a final cover (for units closed as a landfill), or any other construction that requires Central Valley Water Board staff approval under this Order.
25. The Discharger shall submit for review and approval at least **60 days** prior to proposed discharge, final documentation required in Title 27 Section 20324(d)(1)(C) following the completion of construction of a new Class II waste management unit. The report shall be certified by a registered civil engineer or a certified engineering geologist and include a statement that the liner system was constructed in accordance with the approved design plans and specifications, the CQA Plan, the requirements of the WDRs, and that it meets the performance goals of Title 27. The report shall contain sufficient information and test results to verify that construction was in accordance with the design plans and specifications, the construction quality assurance plan, and the performance goals of Title 27.
26. The Discharger shall not discharge waste onto a newly constructed liner system until the final documentation report has been reviewed and an acceptance letter has been received.

G. STANDARD CLOSURE AND POST-CLOSURE SPECIFICATIONS

1. The final closure and post-closure maintenance plan for the waste management unit shall include at least the following: an itemized cost analysis, closure schedule, any proposed final treatment procedures, map, changes to the unit description presented in the most recent ROWD, future land use, and a construction quality assurance plan [Title 27, § 21769(c) & (d)].
2. Closure of each waste management unit shall be under the direct supervision of a registered civil engineer or certified engineering geologist [Title 27, § 20950(b)].
3. The final cover of waste management units closed as a landfill shall be designed, graded, and maintained to prevent ponding and soil erosion due to high run-off velocities [Title 27, § 21090(b)(1)(A)].
4. The final grading design shall be designed and approved by a registered civil engineer or certified engineering geologist [Title 27, § 21090(b)(1)(C)].
5. All final cover designs shall include a minimum 1-foot thick erosion resistant vegetative layer or a mechanically erosion-resistant layer [Title 27, § 21090(a)(3)(A)(1 & 2)].

6. Areas with slopes greater than ten percent, surface drainage courses, and areas subject to erosion by wind or water shall be designed and constructed to prevent such erosion [Title 27, § 21090(b)(2)].
7. The Discharger shall design storm water conveyance systems for Class II units that are closed as a landfill for a 1,000-year, 24-hour storm event [Title 27, § 21750(e)(3)].
8. Construction or repair of a final cover system's low-hydraulic conductivity layer is to be carried out in accordance with an approved construction quality assurance plan [Title 27, § 21090(b)(1)(E)].
9. Within **30 days** of completion of all closure activities, the Discharger shall certify that all closure activities were performed in accordance with the most recently approved final closure plan and CQA Plan, and in accordance with all applicable regulations. The Discharger shall also certify that units that are closed as a landfill shall be maintained in accordance with an approved post-closure maintenance plan [Title 27, § 21710(c)(6)].
10. The post-closure maintenance period for units closed as a landfill shall continue until the Central Valley Water Board determines that wastes remaining in the landfill unit(s) no longer pose a threat to water quality [Title 27, § 20950(a)(1)].
11. The Discharger shall periodically inspect and identify problems with the final cover including areas that require replanting, erosion, areas lacking free drainage, and any areas damaged by equipment operations [Title 27, § 21090(a)(4)(B)].
12. The Discharger shall repair any cover promptly in accordance with a cover repair plan to be included in the final post-closure maintenance plan [Title 27, § 21090(a)(4)(C)].

H. STANDARD FINANCIAL ASSURANCE PROVISIONS

1. The Discharger shall establish an irrevocable fund (or provide other means) for closure to ensure closure of each Class II unit in accordance with an approved closure plan [Title 27, § 20950(f) and § 22207(a)].
2. The Discharger shall obtain and maintain assurances of financial responsibility for initiating and completing corrective action for all known and reasonably foreseeable releases from the waste management unit [Title 27, § 20380(b) and § 22222].

I. STANDARD MONITORING SPECIFICATIONS

1. The water quality monitoring program shall include appropriate and consistent sampling and analytical procedures and methods designed to ensure that

monitoring results provide a reliable indication of water quality at all monitoring points and background monitoring points [Title 27, § 20415(e)(4)].

2. All monitoring systems shall be designed and certified by a registered geologist or a registered civil engineer [Title 27, § 20415(e)(1)].
3. All monitoring wells shall be cased and constructed in a manner that maintains the integrity of the monitoring well bore hole and prevents the bore hole from acting as a conduit for contaminant transport [Title 27, § 20415(b)(4)(A)].
4. All sample chemical analyses of any material shall be performed by a laboratory certified by the California Department of Health Services [Wat. Code, § 13176(a)].
5. A Detection Monitoring Program for a new Class II waste management unit shall be installed, operational, and one year of monitoring data collected from background monitoring points prior to the discharge of wastes [Title 27, § 20415(e)(6)].
6. Background for water samples shall be represented by the data from all samples taken from applicable background monitoring points during that reporting period (at least one sample from each background monitoring point).
7. The Discharger shall submit for approval, establish, and maintain an approved Sample Collection and Analysis Plan. The Sample Collection and Analysis Plan shall at a minimum include:
 - a. Sample collection procedures describing purging techniques, sampling equipment, and decontamination of sampling equipment;
 - b. Sample preservation information and shipment procedures;
 - c. Sample analytical methods and procedures;
 - d. Sample quality assurance/quality control (QA/QC) procedures;
 - e. Chain of Custody control; and
 - f. Sample analysis information including sample preparation techniques to avoid matrix interferences, method detection limits (MDLs), practical quantitation limits (PQLs) and reporting limits (RLs), and procedures for reporting trace results between the MDL and PQL.

If required by the Executive Officer, the Discharger shall modify the Sample Collection and Analysis Plan to conform with this Order.

8. For any given monitored medium, the samples taken from all monitoring points and background monitoring points to satisfy the data analysis requirements for a given reporting period shall all be taken **within a span not to exceed 30 days**, unless a longer time period is approved, and shall be taken in a manner that ensures sample independence to the greatest extent feasible. Specific methods of collection and analysis must be identified. Sample collection, storage, and analysis shall be performed according to the most recent version of USEPA Methods, such as the latest editions, as applicable, of: (1) Methods for the Analysis of Organics in Water and Wastewater (USEPA 600 Series), (2) Test Methods for Evaluating Solid Waste (SW-846, latest edition), and (3) Methods for Chemical Analysis of Water and Wastes (USEPA 600/4-79-020), and in accordance with the approved Sample Collection and Analysis Plan. Appropriate sample preparation techniques shall be used to minimize matrix interferences.
9. If methods other than USEPA-approved methods or Standard Methods are used, or there is a proposed alternant USEPA method than the one listed in the MRP, the proposed methodology shall be submitted for review and approval prior to use, including information showing its equivalence to the required method.
10. The **methods of analysis and the detection limits** used must be appropriate for the expected concentrations. For the monitoring of any constituent or parameter that is found in concentrations which produce more than 90% non-numerical determinations (i.e., "trace" or "ND") in data from background monitoring points for that medium, the analytical method having the lowest MDL shall be selected from among those methods which would provide valid results in light of any matrix effects or interferences.
11. The laboratory reporting limit (RL) for all reported monitoring data shall be set no greater than the practical quantitation limit (PQL).
12. **"Trace" results** - results falling between the MDL and the PQL - shall be reported as such, and shall be accompanied both by the estimated MDL and PQL values for that analytical run.
13. Laboratory data shall not be altered or revised by the Discharger. If the Discharger observes potential lab errors, it shall identify the issue in the monitoring report and shall describe steps that will be taken to prevent similar errors in the future.
14. **MDLs and PQLs** shall be derived by the laboratory for each analytical procedure, according to State of California laboratory accreditation procedures. These MDLs and PQLs shall reflect the detection and quantitation capabilities of the specific analytical procedure and equipment used by the lab, rather than simply being quoted from USEPA analytical method manuals. In relatively

interference-free water, laboratory-derived MDLs and PQLs are expected to closely agree with published USEPA MDLs and PQLs. MDLs and PQLs shall be reported.

15. If the laboratory suspects that, due to a change in matrix or other effects, the true detection limit or quantitation limit for a particular analytical run differs significantly from the laboratory-derived MDL/PQL values, the results shall be flagged in the laboratory report accordingly, along with estimates of the detection limit and quantitation limit actually achieved. The **MDL shall always be calculated such that it represents the lowest achievable concentration associated with a 99% reliability of a nonzero result.** The PQL shall always be calculated such that it represents the lowest constituent concentration at which a numerical value can be assigned with reasonable certainty that it represents the constituent's actual concentration in the sample. Normally, PQLs should be set equal to the concentration of the lowest standard used to calibrate the analytical procedure.
16. All **QA/QC data** shall be reported, along with the sample results to which they apply, including the method, equipment, analytical detection and quantitation limits, the percent recovery, an explanation for any recovery that falls outside the QC limits, the results of equipment and method blanks, the results of spiked and surrogate samples, the frequency of quality control analysis, and the name and signature of a responsible person from the laboratory. **Sample results shall be reported unadjusted for blank results or spike recoveries.** In cases where contaminants are detected in QA/QC samples (i.e., field, trip, or lab blanks), the accompanying sample results shall be appropriately flagged, but the analytical results shall not be adjusted.
17. Unknown chromatographic peaks shall be reported, flagged, and tracked for potential comparison to subsequent unknown peaks that may be observed in future sampling events. Identification of unknown chromatographic peaks that recur in subsequent sampling events may be required.
18. The sampling interval of each monitoring well shall be appropriately screened and fitted with an appropriate filter pack to enable collection of representative groundwater samples [Title 27, § 20415(b)(4)(B)].
19. All borings are to be logged during drilling under the direct supervision of a registered geologist or registered civil engineer with expertise in stratigraphic well logging [Title 27, § 20415(e)(2)].
20. Soils are to be described according to the Unified Soil Classification System [Title 27, § 20415(e)(2)(A)]. Rock is to be described in a manner appropriate for the purpose of the investigation [Title 27, § 20415(e)(2)(B)].

21. The Discharger shall submit a work plan for review and approval at least **60 days** prior to installation or abandonment of groundwater monitoring wells.
22. The Discharger shall provide Central Valley Water Board staff a minimum of **one week** notification prior to commencing any field activities related to the installation or abandonment of monitoring devices.
23. The water quality protection standard shall consist of the constituents of concern (COC), concentration limits, and the point of compliance. The water quality protection standard shall apply during the active life of the waste management unit, closure period, post-closure maintenance period, and any compliance period under Title 27, section 20410 [Title 27, § 20390].
24. The point of compliance at which the water quality protection standard applies is a vertical surface located at the hydraulically downgradient limit of the waste management unit that extends through the uppermost aquifer underlying the unit [Title 27, § 20405).
25. The compliance period is the minimum period of time during which the Discharger shall conduct a water quality monitoring program and is the number of years equal to the active life of the waste management unit plus the closure period [Title 27, § 20410(a)].
26. The groundwater monitoring system shall include a sufficient number of monitoring points, installed at appropriate locations, to yield groundwater samples from the uppermost aquifer that represent the quality of groundwater that has not been affected by a release from the waste management unit [Title 27, § 20415(b)(1)(A)].
27. The Detection Monitoring Program shall include a sufficient number of monitoring points, installed at appropriate locations and depths to yield groundwater samples from the uppermost aquifer that represent the quality of groundwater passing the point of compliance to allow the detection of a release from the waste management unit [Title 27, § 20415(b)(1)(B)1.].
28. Additional monitoring points shall be added as necessary to provide the best assurance of the **earliest possible detection** of a release from the waste management unit [Title 27, § 20415(b)(1)(B)2.].
29. The Detection Monitoring Program shall also include a sufficient number of monitoring points installed at appropriate depths and locations to yield groundwater samples from other aquifers or perched zones not already monitored to provide the **earliest possible detection** of a release from the waste management unit [Title 27, § 20415(b)(1)(B)3. and 4., and §20420(b)].

30. A surface water monitoring system shall be established to monitor each surface water body that could be affected by a release from the waste management unit [Title 27, § 20415(c)].
31. An unsaturated zone monitoring system shall be established for each waste management unit [Title 27, § 20415(d)].
32. The Discharger shall notify Central Valley Water Board staff within **seven days** if fluid is detected in a previously dry LCRS, unsaturated zone monitoring system, or if a progressive increase is detected in the volume of fluid in a LCRS [Title 27, § 21710(c)(3)].
33. Driller's logs for all monitoring wells shall to be submitted to the Central Valley Water Board and the Department of Water Resources [Wat. Code, § 13751 and Title 27, § 20415(b)(3)].
34. Groundwater elevation, temperature, electrical conductivity, turbidity, and pH are to be accurately measured at each well each time groundwater is sampled [Title 27, § 20415(e)(13)].
35. The groundwater flow rate and direction in the uppermost aquifer and in any zones of perched water and in any additional portions of the zone of saturation being monitored shall be determined at least quarterly [Title 27, § 20415(e)(15)].
36. The Discharger shall graph all analytical data from each monitoring point and background monitoring point and shall submit the graphs to the Central Valley Water Board annually [Title 27, § 20415(e)(14)].
37. For each waste management unit, the Discharger shall collect all data necessary for selecting appropriate data analysis methods for establishing background values for each constituent of concern and for each monitoring parameter [Title 27, § 20420(c)]. The Discharger shall propose a data analysis method that includes a detailed description of the criteria to be used for determining "measurably significant" (as defined in Title 27, section 20164) evidence of a release from the waste management unit and determining compliance with the water quality protection standard [Title 27, § 20415(e)(6) and (7)].
38. For statistical analysis of data, the Discharger shall use one of the methods described in Title 27, section 20415(e)(8)(A)-(E). A non-statistical data analysis method can be used if the method can achieve the goal of the particular monitoring program at least as well as the most appropriate statistical method [Title 27, § 20415(e)(8)]. The Discharger shall use a statistical or nonstatistical data analysis method that complies with Title 27, section 20415(e)(7, 8, 9, and 10), to compare the concentration of each constituent of concern or monitoring parameter with its respective background concentration to determine whether

there has been a measurably significant evidence of a release from the waste management unit. For any given monitoring point at which a given constituent has already exhibited a measurably significant indication of a release at that monitoring point, the Discharger may propose to monitor the constituent, at that well, using a concentration-versus-time plot.

39. The Discharger may propose an alternate statistical method [to the methods listed under Title 27, section 20415(e)(8)(A-D)] in accordance with Title 27, section 20415(e)(8)(E), for review and approval.
40. The statistical method shall account for data below the practical quantitation limit (PQL) with one or more statistical procedures that are protective of human health and the environment. Any PQL validated pursuant to Title 27, section 20415(e)(7) that is used in the statistical method shall be **the lowest concentration (or value) that can be reliably achieved** within limits of precision and accuracy specified in the WDRs or an approved Sample Collection and Analysis Plan for routine laboratory operating conditions that are available to the facility. The Discharger's technical report (Sample Collection and Analysis Plan and/or Water Quality Protection Standard Report), pursuant to Title 27, section 20415(e)(7), shall consider the PQLs listed in Appendix IX, Article 19 to Chapter 14 of Division 4.5 of Title 22, CCR, for guidance when specifying limits of precision and accuracy. For any given constituent monitored at a background or downgradient monitoring point, an indication that falls between the MDL and the PQL for that constituent (hereinafter called a "trace" detection) shall be identified and used in appropriate statistical or non-statistical tests. Nevertheless, for a statistical method that is compatible with the proportion of censored data (trace and ND indications) in the data set, the Discharger can use the laboratory's concentration estimates in the trace range (if available) for statistical analysis, in order to increase the statistical power by decreasing the number of "ties".
41. The water quality protection standard for organic compounds which are not naturally occurring and not detected in background groundwater samples shall be taken as the detection limit of the analytical method used (e.g., USEPA methods 8260 and 8270).
42. Alternate statistical procedures may be used for determining the significance of analytical results for common laboratory contaminants (i.e., methylene chloride, acetone, diethylhexyl phthalate, and di-n-octyl phthalate) if part of an approved water quality protection standard. Nevertheless, analytical results involving detection of these analytes in any background or downgradient sample shall be reported and flagged for easy reference by Central Valley Water Board staff.
43. **Confirmation of Measurably Significant Evidence of a Release.** Whenever a constituent is detected at a detection monitoring point at a concentration that exceeds the concentration limit from the water quality protection standard, the

Discharger shall conduct verification sampling to confirm if the exceedance is due to a release or if it is a false-positive (unless previous monitoring has already confirmed a release for that constituent at that monitoring point). An exceedance of the concentration limit from the water quality protection standard is considered measurably significant evidence of a release that must be either confirmed or denied. There are two separate verification testing procedures:

- a. Standard Monitoring Specification I.44 provides the procedure for analytes that are detected in less than 10% of the background samples such as non-naturally occurring constituents like volatile organic compounds; and
- b. Standard Monitoring Specification I.45 provides the procedure for analytes that are detected in 10% or greater of the background samples such as naturally occurring constituents like chloride.

44. Verification Procedure for Analytes Detected in Less than 10% of Background Samples. The Discharger shall use the following non-statistical method for all analytes that are detected in less than 10% of the background samples. The non-statistical method shall be implemented as follows:

- a. **Initial Determination of Measurably Significant Evidence of a Release.** Identify each analyte in the **current** detection monitoring point sample that exceeds either its respective MDL or PQL, and for which a release has not been previously confirmed. The Discharger shall conclude that the exceedance provides a preliminary indication of a release or a change in the nature or extent of the release, at that monitoring point, if **either**:
 - 1) The data contains two or more analytes that equal or exceed their respective MDLs; or
 - 2) The data contains one or more analyte that equals or exceeds its PQL.
- b. **Discrete Retest** [Title 27, § 20415(e)(8)(E) and § 20420(j)(1-3)]:
 - 1) In the event that the Discharger or Central Valley Water Board staff concludes (pursuant to paragraph I.44.a., above) that there is a preliminary indication of a release, then the Discharger shall **immediately** notify Central Valley Water Board staff by phone or e-mail and, within **30 days** of such indication, shall collect two new (retest) samples from the monitoring point where the release is preliminarily indicated and analyze them for the constituents that caused the need for the retest.
 - 2) **Confirmation of a Release.** As soon as the retest data are available, the Discharger shall conclude that measurably significant evidence of a release is confirmed if (not including the original sample) two or more

analytes equal or exceed their respective MDLs or if one or more analyte equals or exceeds its PQL. The Discharger shall then:

- a) **Immediately** verbally notify the Central Valley Water Board whether or not the retest confirmed measurably significant evidence of a release for the analyte at the monitoring point, and follow up with written notification submitted by certified mail **within seven days** of the verbal notification; and
- b) Carry out the requirements of Section J, **RESPONSE TO A RELEASE** if a release has been confirmed.
- c) Add any five-year analyte that is confirmed per this method to the monitoring parameter list such that it is monitored during each regular monitoring event.

45. **Verification Procedure for Analytes Detected in 10% or Greater of the Background Samples.** The Discharger shall use either a statistical or non-statistical method pursuant to Title 27, section 20415(e)(8)(E) for all analytes that are detected in 10% or greater of the background samples. The Discharger shall use one of the statistical methods required in Title 27, section 20415(e)(8)(E) unless another method has been proposed by the Discharger in a Water Quality Protection Standard Report (or equivalent report) and approved by the Central Valley Water Board in a Monitoring and Reporting Program pursuant to Title 27, section 20415(e)(8)(A-D)] or section 20415(e)(8)(E). The method shall be implemented as follows:

- a. **Initial Determination of Measurably Significant Evidence of a Release.** The Discharger shall compare the value reported by the laboratory for each analyte to the statistically-derived concentration limit from the most recent report (Annual Monitoring Report or Water Quality Protection Standard Report) that uses the approved statistical procedure. If the value exceeds the concentration limit for that constituent, the Discharger shall conclude that there is measurably significant evidence of a release [Title 27, § 20420(i)].
- b. **Retest Method** [Title 27, § 20415(e)(8)(E) and § 20420(j)(1-3)].
 - 1) In the event that the Discharger or Central Valley Water Board staff concludes (pursuant to paragraph I.45.a., above) that there is a preliminary indication of a release, then the Discharger shall **immediately** notify Central Valley Water Board staff by phone or e-mail and, within **30 days** [Title 27, § 20415(e)(8)(E)(3)] of such indication, the Discharger shall implement a verification procedure/retest option, in accordance with Title 27, sections 20415(e)(8)(E) and 20420(j)(2). The verification procedure shall include either a single “composite” retest (i.e., a statistical analysis that augments and reanalyzes the data from the monitoring point that indicated a release) or shall consist of at least two “discrete” retests

(i.e., statistical analyses each of which analyzes only newly-acquired data from the monitoring point that indicated a release) [Title 27, § 20415(e)(8)(E)]. The Discharger may use an alternate method previously approved by the Central Valley Water Board and included in the Monitoring and Reporting Program. The verification procedure shall comply with the requirements of Title 27, section 20415(e)(8)(E) in addition to the performance standards of Title 27, section 20415(e)(9). The retest samples shall be collected from the monitoring point where the release is preliminarily indicated and shall be analyzed for the constituents that caused the need for the retest. For any indicated monitoring parameter or constituent of concern, if the retest results of one or more of the retest data suites confirm the original indication, the Discharger shall conclude that measurably significant evidence of a release has been confirmed.

- 2) **Confirmation of a Release.** As soon as the retest data are available, the Discharger shall evaluate the results pursuant to paragraph I.45.b.1, above and shall:
 - a) **Immediately** verbally notify the Central Valley Water Board whether or not the retest confirmed measurably significant evidence of a release for the analyte at the monitoring point, and follow up with written notification submitted by certified mail **within seven days** of the verbal notification; and
 - b) Carry out the requirements of Section J, **RESPONSE TO A RELEASE** if a release has been confirmed.
 - c) Add any five-year analyte that is confirmed per this method to the monitoring parameter list such that it is monitored during each regular monitoring event.

46. **Physical Evidence of a Release.** If the Discharger determines that there is a significant **physical** evidence of a release, the Discharger shall immediately verbally notify Central Valley Water Board staff and provide written notification **by certified mail within 7 days** of such determination, and within **90 days** shall submit an amended report of waste discharge to establish an Evaluation Monitoring Program [Title 27, § 20385(a)(3) and § 20420(l)(1) & (2)].

J. RESPONSE TO A RELEASE

1. **Measurably Significant Evidence of a Release Has Been Confirmed.** If the Discharger has confirmed that there is measurably significant evidence of a release from a waste management unit pursuant to Standard Monitoring Specification I.44 or I.45, then the Discharger shall:
 - a. **Immediately** sample all monitoring points in the affected medium at that waste management unit and determine the concentration of all monitoring parameters and constituents of concern for comparison with established concentration limits. Because this constituent of concern can does not involve statistical testing, the Discharger will need to collect and analyze only a single water sample from each monitoring point in the affected medium [Title 27, § 20420(k)(1)].
 - b. **Within 90 days** of confirming measurably significant evidence of a release, the Discharger shall submit an amended report of waste discharge to establish an Evaluation Monitoring Program meeting the requirements of Title 27, sections 20420(k)(5)(A-D), including but not limited to the results of sampling pursuant to paragraph J.1.a, above. The Evaluation Monitoring Program shall be designed for the collection and analysis of all data necessary to assess the nature and extent of the release and to determine the spatial distribution and concentration of each constituent throughout the zone affected by the release [Title 27, § 20420(k)(5) and § 20425(b)].
 - c. **Within 180 days** of confirming measurably significant evidence of a release, the Discharger shall submit to the Central Valley Water Board an initial engineering feasibility study for a Corrective Action Program necessary to meet the requirements of Title 27, section 20430. At a minimum, the initial engineering feasibility study shall contain a detailed description of the corrective action measures that could be taken to achieve background concentrations for all constituents of concern [Title 27, § 20420(k)(6)].
 - d. If the Discharger confirms that there is measurably significant evidence of a release from the waste management unit at any monitoring point, the Discharger may attempt to demonstrate that a source other than the waste management unit caused the evidence of a release or that the evidence is an artifact caused by an error in sampling, analysis, or statistical evaluation or by natural variation in groundwater, surface water, or the unsaturated zone. The Discharger may make a demonstration pursuant to Title 27, section 20420(k)(7) in addition to or in lieu of submitting both an amended report of waste discharge or an engineering feasibility study; however, the Discharger is not relieved of the requirements and due dates of Title 27, sections 20420(k)(6) & (7) unless Central Valley Water Board staff agree that the demonstration successfully shows that a source other than the waste management unit caused the evidence of a release or that the evidence resulted from error in sampling, analysis, or statistical evaluation

or from natural variation in groundwater, surface water, or the unsaturated zone. In order to make this demonstration, the Discharger shall notify the Central Valley Water Board by certified mail of the intent to make the demonstration **within seven days** of determining measurably significant evidence of a release, and shall submit a report **within 90 days** of determining measurably significant evidence of a release [Title 27, § 20420(k)(7)].

- e. **Within 90 days** of the date that the Evaluation Monitoring Program from paragraph J.1.b is approved (the date it is established), the Discharger shall complete and submit the following:
 - i) **Results and Assessment for the Evaluation Monitoring Program.** A report with the results and assessment based on the approved Evaluation Monitoring Program [Title 27, § 20425(b)].
 - ii) **Updated Engineering Feasibility Study.** An updated engineering feasibility study for corrective action based on the data collected to delineate the release and data from the ongoing monitoring program required under Title 27, section 20425(e) [Title 27, § 20425(c)].
 - iii) **Amended ROWD for a Corrective Action Program.** An amended report of waste discharge to establish a Corrective Action Program meeting the requirements of Title 27, section 20430 based on the data collected to delineate the release and based on the updated engineering feasibility study [Title 27, § 20425(d)].

K. GENERAL PROVISIONS

1. In the event the Discharger does not comply or will be unable to comply with any prohibition or limitation of this Order for any reason, the Discharger shall notify the appropriate Central Valley Water Board office by telephone **as soon as** it or its agents have knowledge of such noncompliance or potential for noncompliance, and shall confirm this notification in writing **within two weeks**. The written notification shall state the nature, time, and cause of noncompliance, and shall describe the measures being taken to prevent recurrences and shall include a timetable for corrective actions.
2. All reports and transmittal letters shall be signed by persons identified below:
 - a. For a corporation: by a principal executive officer of at least the level of senior vice-president.
 - b. For a partnership or sole proprietorship: by a general partner or the proprietor.

- c. For a municipality, state, federal or other public agency: by either a principal executive officer or ranking elected or appointed official.
 - d. A duly authorized representative of a person designated in a, b or c above if:
 - 1) The authorization is made in writing by a person described in a, b, or c of this provision;
 - 2) The authorization specifies either an individual or a position having responsibility for the overall operation of the regulated facility or activity, such as the position of plant manager, operator of a Unit, superintendent, or position of equivalent responsibility (a duly authorized representative may thus be either a named individual or any individual occupying a named position); and
 - 3) The written authorization is submitted to the Central Valley Water Board.
 - e. Any person signing a document under this Section shall make the following certification:

“I certify under penalty of law that I have personally examined and am familiar with the information submitted in this document and all attachments and that, based on my inquiry of those individuals immediately responsible for obtaining the information, I believe that the information is true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment.”
- 3. The Discharger shall take all reasonable steps to minimize any adverse impact to the waters of the State resulting from noncompliance with this Order. Such steps shall include accelerated or additional monitoring as necessary to determine the nature, extent, and impact of the noncompliance.
 - 4. The owner of the waste management facility shall have the continuing responsibility to assure protection of waters of the state from discharged wastes and leachate generated by discharged waste during the active life, closure, and any post-closure maintenance period of the waste management units and during subsequent use of the property for other purposes.
 - 5. The fact that it would have been necessary to halt or reduce the permitted activity in order to maintain compliance with this Order shall not be regarded as a defense for the Discharger's violations of this Order.
 - 6. The Discharger shall notify the Central Valley Water Board of a material change in; the types, quantity, or concentrations of wastes discharged; site operations and features; or proposed closure procedures, including changes in cost

estimates. This notification shall be given a reasonable time before the changes are made or become effective. No changes shall be made without Central Valley Water Board approval following authorization for closure pursuant to the site Notification of Closure [Title 27, § 21710(a)(4)].

7. The Discharger shall maintain legible records of the volume and type of each waste discharged at each waste management unit or portion of a unit, and the manner and location of discharge. Such records shall be maintained by the Discharger until the beginning of the post-closure maintenance period. These records shall be on forms approved by the State Water Board or Central Valley Water Board and shall be maintained at the waste management facility until the beginning of the post-closure maintenance period. These records shall be available for review by representatives of the State Water Board or Central Valley Water Board at any time during normal business hours. At the beginning of the post-closure maintenance period, copies of these records shall be sent to the Central Valley Water Board [Title 27, § 21720(f)].
8. In the event of any change in landowner or the operator of the waste management facility, the Discharger shall notify the succeeding owner or operator in writing of the existence of this Order. A copy of that notification shall be sent to the Central Valley Water Board.
9. In the event of any change of ownership or responsibility for construction, operation, closure, or post-closure maintenance of the waste discharge facilities described in this Order, the Discharger shall notify the Central Valley Water Board prior to the effective date of the change and shall include a statement by the new Discharger that construction, operation, closure, or post-closure maintenance will be in compliance with this Order and any revisions thereof [Title 27, § 21710(c)(1)].
10. To assume ownership or operation under this Order, the succeeding owner or operator must apply in writing to the Central Valley Water Board requesting transfer of the Order within **14 days** of assuming ownership or operation of this facility. The request must contain the requesting entity's full legal name, the State of incorporation if a corporation, the name and address and telephone number of the persons responsible for contact with the Central Valley Water Board, and a statement. The statement shall comply with the signatory requirements contained in General Provision K.2 and state that the new owner or operator assumes full responsibility for compliance with this Order. Failure to submit the request shall be considered a discharge without requirements, a violation of the Water Code. Transfer of this Order shall be approved or disapproved by the Central Valley Water Board.

L. STORM WATER PROVISIONS

1. The Discharger shall design storm water conveyance systems for Class II units for a 1,000-year, 24-hour storm event [Title 27, § 21750(e)(3)].

2. Waste management units and their respective containment structures shall be designed and constructed to limit, to the greatest extent possible, ponding, infiltration, inundation, erosion, slope failure, washout, and overtopping under the precipitation conditions for the unit [Title 27, § 20365(a)].
3. Precipitation on Class II waste piles which is not diverted by covers or drainage control systems shall be collected and managed through the LCRS, which shall be designed and constructed to accommodate the precipitation conditions for each class unit [Title 27, § 20365(b)].
4. Diversion and drainage facilities shall be designed, constructed, and maintained to [Title 27, § 20365(c)]:
 - a. Accommodate the anticipated volume of precipitation and peak flows from surface runoff and under the precipitation conditions for the waste management unit.
 - b. Effectively divert sheet flow runoff laterally, via the shortest distance, into the drainage and collection facilities.
 - c. Prevent surface erosion through the use of energy dissipators where required to decrease the velocity of runoff, slope protection, and other erosion control measures where needed to prevent erosion.
 - d. Control and intercept run-on, in order to isolate uncontaminated surface waters from water that might have come into contact with waste.
 - e. Take into account:
 - i) For closed waste management units and for closed portions of units, the expected final contours of the closed unit, including its planned drainage pattern.
 - ii) For operating portions of waste management units other than surface impoundments, the unit's drainage pattern at any given time.
 - iii) The possible effects of the waste management unit's drainage pattern on and by the regional watershed.
 - iv) The design capacity of drainage systems of downstream and adjacent properties by providing for the gradual release of retained water downstream in a manner which does not exceed the expected peak flow rate at the point of discharge if there were no waste management facility.
 - f. Preserve the system's function. The Discharger shall periodically remove accumulated sediment from the sedimentation or detention basins as needed to preserve the design capacity of the system.

5. Collection and holding facilities associated with precipitation and drainage control systems shall be emptied immediately following each storm or otherwise managed to maintain the design capacity of the system [Title 27, § 20365(d)].
6. Surface and subsurface drainage from outside of a waste management unit shall be diverted from the unit [Title 27, § 20365(e)].
7. Cover materials shall be graded to divert precipitation from the waste management unit, to prevent ponding of surface water over wastes, and to resist erosion as a result of precipitation [Title 27, § 20365(f)].
8. Any drainage layer in a final cover shall be designed and constructed to intersect with the final drainage system for the waste management unit in a manner promoting free drainage from all portions of the drainage layer [Title 27, §20365(f)].
